Phenomics in Crop Plants: Trends, Options and Limitations Jitendra Kumar,Aditya Pratap,Shiv Kumar,2015-03-05 Identification of desirable genotypes with

traits of interest is discernible for making genetic improvement of crop plants In this direction screening of a large number of germplasm for desirable traits and transfer of identified traits into agronomic backgrounds through recombination breeding is the common breeding approach Although visual screening is easier for qualitative traits its use is not much effective for quantitative traits and also for those which are difficult to score visually Therefore it is imperative to phenotype the germplasm accessions and breeding materials precisely using high throughput phenomics tools for challenging and complex traits under natural controlled and harsh environmental conditions Realizing the importance of phenotyping data towards identification and utilization of a germplasm as donors global scientific community has exerted increased focus on advancing phenomics in crop plants leading to development of a number of techniques and methodologies for screening of agronomic physiological and biochemical traits These technologies have now become much advanced and entered the era of digital science This book provides exhaustive information on various aspects related to phenotyping of crop plants and offers a most comprehensive reference on the developments made in traditional and high throughput phenotyping of agricultural crops

Proceedings of the 1987 International Deepwater Rice Workshop ,1988 **Crop Stress and its Management:**

Perspectives and Strategies B. Venkateswarlu,Arun K. Shanker,Chitra Shanker,M. Maheswari,2011-11-22 Crops

experience an assortment of environmental stresses which include abiotic viz drought water logging salinity extremes of

temperature high variability in radiation subtle but perceptible changes in atmospheric gases and biotic viz insects birds other pests weeds pathogens viruses and other microbes The ability to tolerate or adapt and overwinter by effectively countering these stresses is a very multifaceted phenomenon In addition the inability to do so which renders the crops susceptible is again the result of various exogenous and endogenous interactions in the ecosystem Both biotic and abiotic stresses occur at various stages of plant development and frequently more than one stress concurrently affects the crop Stresses result in both universal and definite effects on plant growth and development One of the imposing tasks for the crop researchers globally is to distinguish and to diminish effects of these stress factors on the performance of crop plants especially with respect to yield and quality of harvested products This is of special significance in view of the impending climate change with complex consequences for economically profitable and ecologically and environmentally sound global agriculture The challenge at the hands of the crop scientist in such a scenario is to promote a competitive and multifunctional agriculture leading to the production of highly nourishing healthy and secure food and animal feed as well as raw materials for a wide variety of industrial applications In order to successfully meet this challenge researchers have to understand the various aspects of these stresses in view of the current development from molecules to ecosystems The book will focus on broad research areas in relation to these stresses which are in the forefront in contemporary crop stress research
