Frank D. Masch

Tidal Hydrodynamics:

Tidal Hydrodynamics Bruce B. Parker, 1991-09-03 Consists of refereed papers by the world's leading authorities on tidal hydrodynamics. Its forty-four papers, including nine review papers, cover all aspects of the subject and present for the first time in one place state-of-the-art treatments of recent advances, including tidal detection from satellite altimetry, global tide modeling, nonlinear tidal interactions, and internal tidal phenomena. Numerical Simulation of Tidal Hydrodynamics, Great Egg Harbor and Corson Inlets, New Jersey H. Lee Butler, 1978 Great Egg Harbor Inlet and Corson Inlet, located in southeast New Jersey, have been plagued with hazardous navigation conditions and erosion problems. Numerical techniques were used to investigate the tidal hydrodynamics of the inlet complexes for existing conditions as well as for proposed improvement plans. The physical size and complex geometry of the study areas required a simulation model that could be economically applied. Consequently, an inherent part of the study involved development of a numerical model. The model is based on an implicit finite difference formulation. Results of the numerical computations indicated that the systems proposed for Corson Inlet appear to function equally well and no detrimental effects were noted. For Great Egg Harbor Inlet, a concentration of ebb flow toward the upcoast deposition basin and structure was noted, suggesting a potential problem which should be recognized for the proposed plans. Time histories of tide elevations and velocities are presented for selected stations throughout each inlet complex. Circulation patterns at each half hour during a complete tidal cycle are presented in film form for the verification conditions and for each plan.

Tidal Inlets J. van de Kreeke, R. L. Brouwer, 2017-06-22 Using field observations and simple models, this book describes the latest developments in the hydrodynamics and morphodynamics of tidal inlets.

Introduction to Estuarine Hydrodynamics Arnoldo Valle-Levinson, 2022-03-03 This textbook provides an in-depth overview of the hydrodynamics of estuaries and semi-enclosed bodies of water. It begins by describing the typical classification of estuaries, followed by a presentation of the quantitative tools needed to study these basins: conservation of mass, salt, heat, momentum, and the thermodynamic equation of seawater. Further topics explore tides in homogeneous basins, including shallow water tides and tidal residual flows, wind-driven flows in homogeneous basins, density-driven flows, as well as interactions among tides, winds, and density gradients. The book proposes a classification of semi-enclosed basins that is based on dominant dynamics, comparing forcing agents and restorative or balancing forces.

Introduction to Estuarine Hydrodynamics provides an introduction for advanced students and researchers across a range of disciplines: Earth science, environmental science, biology, chemistry, geology, hydrology, physics related to the study of estuarine systems.

Tidal Hydrodynamics in a Multi-inlet Wetland System Mithun Deb, 2023 Modeling hydrodynamics and sediment

transport inside a multi inlet wetland system is a challenging task due to constraints on model efficiency accuracy and representation of physics the scarcity of field data for model validation and more importantly the availability of high resolution data sets of marsh topography and channel bathymetry Lack of field data sets model assumptions and limitations often lead to wrong interpretation of the system s nature To correctly predict the changes in governing hydrodynamics and morphology of shallow wetland environments it is essential to resolve the complex interaction between the tidal channel and marsh surface with the best possible accuracy In this thesis we describe the development of a high resolution 2D numerical model for a rapidly eroding tidal wetland system using the Finite Volume primitive equation Community Ocean Model FVCOM Topo bathymetric survey data and water surface and current velocity measurements during calm and stormy conditions have been collected in support of model development and validation The model is then used to perform a morphology scenario analysis to evaluate the effect of anthropogenic and natural disturbances in altering overall wetland hydrodynamics The study has also shown the role of horizontal model resolution around the marsh channel shoreline and surveyed bathymetry data in improving the model calculations for major physical processes such as channel surface phase lag tidal wave characteristics and flow asymmetry Hydrodynamic processes over marsh topography are seen to be significantly affected by surface defects such as cuts and rills on the marsh platform Inadequate representation of these meter scale features from spatial resolution available from data sources such as LiDAR as well as the incomplete resolution in the model grid itself lead to artificial ponding over the isolated marsh depressions with resulting effects on estimates of sediment fluxes and hydroperiod A new set of mass and momentum conservation equations is proposed using a surface porosity technique to improve the dynamic wetting and drying over artificially isolated depressions This model improvement is essential for accurate predictions of marsh hydroperiod and volume flux that primarily controls the sedimentation rate and overall morphological evolution Ultimately by solving these critical processes the study has provided useful solutions to improve the present day limitations in numerical modeling of salt marsh flooding and draining
