Soil Suction Applications In Geotechnical Engineering Practice:

Soil Suction Applications in Geotechnical Engineering Practice Warren K. Wray, Sandra L. Houston, 1995 This proceedings Soil Suction Applications in Geotechnical Engineering Practice consists of papers presented in a technical session at the 1995 ASCE Annual Convention held in San Diego California October 22 26 1995 The papers address practical applications of using soil suction in the practice of geotechnical engineering in unsaturated soils Case histories are emphasized The issues addressed in these proceedings are intended to demonstrate the applicability of soil suction to solve problems involving geotechnical engineering problems occurring in unsaturated soils to encourage the use of soil suction in addressing practical problems and to show advances in applying unsaturated soil mechanics

Unsaturated Soil Concepts and Their Application in Geotechnical Practice David G. Toll, 2013-04-17 model They conclude that the models using three fitting parameters provide the best fit over a wide range of suctions Models for soil water characteristic curves are only useful if we have experimental data on which to base them Agus Leong and Rahardjo Singapore present a large number of experimental soil water characteristic curves determined for two types of residual soil from Singapore They present data for eight different sites This data set allows them to relate the parameters of the soil water characteristic curves to index properties They conclude that the relationships derived are suitable to provide a quick preliminary estimate of a soil water characteristic curve The importance of soil water characteristic curves is emphasized by another contribution dealing with this topic Aung Rahardjo Leong and Toll Singapore investigate the relationship between mercury intrusion porosimetry measurements and soil water characteristic curves The porosimetry measurements are presented as soil air characteristic curves The slopes of the soil air characteristic curves are found to be similar to the slopes of the soil water characteristic curves The equivalent pore diameters calculated from the mercury entry value and the air entry value appear to be related Therefore it is suggested that porosimetry data can be used to construct an estimate of the soil water characteristic curve

Simple Techniques for the Implementation of the Mechanics of Unsaturated Soils Into Engineering Practice Won Taek Oh, 2012 Over the past 50 years several advancements have been made in the research area of the mechanics of unsaturated soils These advancements can be categorized into two groups i development or improvement of testing techniques or apparatus to determine the mechanical properties of unsaturated soils and ii development of numerical empirical or semi empirical models to estimate the variation of mechanical properties of unsaturated soils with respect to suction based on the experimental results Implementation of the mechanics of unsaturated soils in conventional geotechnical engineering practice however has been rather limited The key reasons for the limited practical applications may be attributed to the lack of simple and reliable methods for i measuring soil suction in the field quickly and reliably and ii estimating the variation of mechanical properties of unsaturated soils with

respect to suction The main objective of this thesis research is to develop simple and reliable techniques models or approaches that can be used in geotechnical engineering practice to estimate soil suction and the mechanical properties of unsaturated soils This research can be categorized into three parts In the First Part simple techniques are proposed to estimate the suction values of as compacted unsaturated fine grained soils using a pocket penetrometer and a conventional tensiometer The suction values less than 300 kPa can be estimated using a strong relationship between the compressive strength measured using a pocket penetrometer and matric suction value The high suction values in the range of 1 200 kPa to 60 000 kPa can be estimated using the unique relationship between the initial tangent of conventional tensiometer response versus time behavior and suction value In the Second Part approaches or semi empirical models are proposed to estimate the variation of mechanical properties of unsaturated soils with respect to suction which include Bearing capacity of unsaturated fine grained soils Variation of bearing capacity of unsaturated fine grained soils with respect to matric suction Variation of initial tangent elastic modulus of unsaturated soils below shallow foundations with respect to matric suction Variation of maximum shear modulus with respect to matric suction for unsaturated non plastic sandy soils i e plasticity index I_p 0 % In the Third Part approaches or methodologies are suggested to simulate the vertically applied stress versus surface settlement behavior of shallow foundations in unsaturated coarse grained soils assuming elastic perfectly plastic behavior These methodologies are extended to simulate the stress versus settlement behavior of both model footings and in situ plates in unsaturated coarse grained soils The results show that there is a reasonably good comparison between the measured values i e soil suction bearing capacity elastic and shear modulus and those estimated using the techniques or models proposed in this thesis research The models or methodologies proposed in this thesis research are promising and encouraging for modeling studies and practicing engineers to estimate the variation of mechanical behavior of unsaturated soils with respect to matric suction
