to evaluate the existing methodologies for determining carbon fractions in soils that might be applied to the question of

forest soil C sequestration A great deal of research has been done on this topic although often focused on agronomic soils

Forest land managers will be increasingly interested in identifying methods to monitor and to evaluate the effects of forest

practices on soil C reserves As well researchers are interested in this and the logical linkages to N cycling Ultimately

practical methods that can be widely utilized will be needed these may come from current methods or be developed through
