Unidimensional Scaling:

Unidimensional Scaling John McIver, Edward G. Carmines, 1981 Provides an introduction to the fundamentals of scaling theory and construction The authors present an overview and comparative analysis of such techniques as Thurstone scaling Likert scaling Guttman scaling and unfolding theory Unidimensional Scaling of Social Variables Raymond L. Gordon, 1977

Modern Multidimensional Scaling I. Borg, P. J. F. Groenen, 2007-04-27 Multidimensional scaling MDS is a technique for the analysis of similarity or dissimilarity data on a set of objects Such data may be intercorrelations of test items ratings of similarity on political candidates or trade indices for a set of countries MDS attempts to model such data as distances among points in a geometric space The main reason for doing this is that one wants a graphical display of the structure of the data one that is much easier to understand than an array of numbers and moreover one that displays the essential information in the data smoothing out noise There are numerous varieties of MDS Some facets for distinguishing among them are the particular type of geometry into which one wants to map the data the mapping function the algorithms used to find an optimal data representation the treatment of statistical error in the models or the possibility to represent not just one but several similarity matrices at the same time Other facets relate to the different purposes for which MDS has been used to various ways of looking at or interpreting an MDS representation or to differences in the data required for the particular models In this book we give a fairly comprehensive presentation of MDS For the reader with applied interests only the first six chapters of Part I should be sufficient They explain the basic notions of ordinary MDS with an emphasis on how MDS can be helpful in answering substantive questions **Color Space and Its Divisions** Rolf G. Kuehni, 2003-04-28 It has been postulated that humans can differentiate between millions of gradations in color Not surprisingly no completely adequate detailed catalog of colors has yet been devised however the quest to understand record and depict color is as old as the quest to understand the fundamentals of the physical world and the nature of human consciousness Rolf Kuehni's Color Space and Its Divisions Color Order from Antiquity to the Present represents an ambitious and unprecedented history of man's inquiry into color order focusing on the practical applications of the most contemporary developments in the field Kuehni devotes much of his study to geometric three dimensional arrangements of color experiences a type of system developed only in the mid nineteenth century Color spaces are of particular interest for color quality control purposes in the manufacturing and graphics industries The author analyzes three major color order systems in detail Munsell OSA UCS and NCS He presents historical and current information on color space developments in color vision psychology psychophysics and color technology Chapter topics include A historical account of color order systems Fundamentals of psychophysics and the relationship between stimuli and experience Results of perceptual scaling of colors according to attributes History of the development of mathematical color space and difference formulas Analysis of the agreements and discrepancies in psychophysical data describing color differences An experimental plan for the reliable replicated perceptual data necessary

to make progress in the field Experts in academia and industry neuroscientists designers art historians and anyone interested in the nature of color will find *Color Space and Its Divisions* to be the authoritative reference in its field

Branch-and-Bound Applications in Combinatorial Data Analysis Michael J. Brusco, Stephanie Stahl, 2005-11-30 This monograph focuses on the application of the solution strategy known as branch and bound to problems of combinatorial data analysis Combinatorial data analysis problems typically require either the selection of a subset of objects from a larger master set the grouping of a collection of objects into mutually exclusive and exhaustive subsets or the sequencing of objects To obtain verifiably optimal solutions for this class of problems we must evaluate either explicitly or implicitly all feasible solutions Unfortunately the number of feasible solutions for problems of combinatorial data analysis grows exponentially with problem size For this reason the explicit enumeration and evaluation of all solutions is computationally infeasible for all but the smallest problems The branch and bound solution method is one type of partial enumeration solution strategy that enables some combinatorial data analysis problems to be solved optimally without explicitly enumerating all feasible solutions To understand the operation of a branch and bound algorithm we distinguish complete solutions from partial solutions A complete solution is one for which a feasible solution to the optimization problem has been produced e.g. all objects are assigned to a group or all objects are assigned a sequence position A partial solution is an incomplete solution e.g. some objects are not assigned to a group or some objects are not assigned a sequence position
