Modeling in Computer Graphics Bianca Falcidieno, Tosiya L. Kunii, 2012-12-06 In the history of technology many fields have passed from an initial stage of empirical recipes to a mature stage where work is based on formal theories and procedures This transition is made possible through a process called modeling Also Computer Graphics as a separate field of Computer Science makes extensive use of formal theories and procedures of modeling often derived from related disciplines such as mathematics and physics Modeling makes different application results consistent unifying varieties of techniques and formal approaches into a smaller number of models by generalizing and abstracting the knowledge in Computer Graphics This volume presents a selection of research papers submitted to the conference Modeling in Computer Graphics Methods and Applications held at the Research Area of the National Research Council in Genoa Italy on June 28 July 1 1993 This meeting was the ideal continuation of a previous conference organized in Tokyo Japan in April 1991 The success and the variety of research themes discussed at that meeting suggested to promote a new working conference on methods and applications of modeling to be held in Italy two years later

**Comprehensive Nanoscience and Technology**, 2010-10-29 From the Introduction Nanotechnology and its underpinning sciences are progressing with unprecedented rapidity With technical advances in a variety of nanoscale fabrication and manipulation technologies the whole topical area is maturing into a vibrant field that is generating new scientific research and a burgeoning range of commercial applications with an annual market already at the trillion dollar threshold The means of fabricating and controlling matter on the nanoscale afford striking and unprecedented opportunities to exploit a variety of exotic phenomena such as quantum nanophotonic and nanoelectromechanical effects Moreover researchers are elucidating new perspectives on the electronic and optical properties of matter because of the way that nanoscale materials bridge the disparate theories describing molecules and bulk matter Surface phenomena also gain a greatly increased significance even the well known link between chemical reactivity and surface to volume ratio becomes a major determinant of physical properties when it operates over nanoscale dimensions Against this background this comprehensive work is designed to address the need for a dynamic authoritative and readily accessible source of information capturing the full breadth of the subject Its six volumes covering a broad spectrum of disciplines including material sciences chemistry physics and life sciences have been written and edited by an outstanding team of international experts Addressing an extensive cross disciplinary audience each chapter aims to cover key developments in a scholarly readable and critical style providing an indispensable first point of entry to the

literature for scientists and technologists from interdisciplinary fields The work focuses on the major classes of nanomaterials in terms of their synthesis structure and applications reviewing nanomaterials and their respective technologies in well structured and comprehensive articles with extensive cross references It has been a constant surprise and delight to have found amongst the rapidly escalating number who work in nanoscience and technology so many highly esteemed authors willing to contribute Sharing our anticipation of a major addition to the literature they have also captured the excitement of the field itself in each carefully crafted chapter Along with our painstaking and meticulous volume editors full credit for the success of this enterprise must go to these individuals together with our thanks for largely adhering to the given deadlines Lastly we record our sincere thanks and appreciation for the skills and professionalism of the numerous Elsevier staff who have been involved in this project notably Fiona Geraghty Megan Palmer and Greg Harris and especially Donna De Weerd Wilson who has steered it through from its inception We have greatly enjoyed working with them all as we have with each other

language English abstract The goal of this thesis is to provide a texture generation approach that works on cellular textures

and enables structural modifications when generating a new output exemplar In the field of computer graphics two

dimensional textures are an efficient tool to make a virtual scene richer in detail and therefore visually more appealing

Consequently the perceived quality of a rendered image highly depends on the quality of the used textures Unfortunately

creating textures by hand is a time consuming task which in extreme cases can only be performed by professional artists On

the other hand the use of real photographs often requires post processing steps e g to make them tileable so that there are

no visual transitions between multiple texture copies covering a large surface Approaches exist that automatically create new

texture variants with different sizes based on a given input sample However most of these methods focus on generating

output textures that are as similar to the original input as possible while not allowing for further modifications
