frame After that the motion vector between the frames of each shot is generated to transfer the colors from the key frame to the following frames in the shot using the motion vector Color image encoding becomes an important application for image colorization The idea is to remove colors from color images at the sender side while retaining the information about colors to enable image recolorization at the receiver side The reason behind this methodology is to exploit from the smaller size of gray images At the receiver side the colors are restored and the images are recolored This Methodology of encoding is called Image Decolorization The thesis presents two different approaches to color images decolorization Color Embedding and Automatically Color Seeds Selection A new system to compress the color channels in the color model Hue Saturation and Intensity HSI is proposed The encoded chromatic channels are hided inside the lighting channel using the Least Significant Bit LSB method This is done by converting the Hue channel into objects and then to be encoded by an Object Compression method For Saturation channel there are two methods to compress S channel are proposed the Minimum Color Difference MCD and Y Luma Intensity Difference YID The third proposed system is a new automatic color seeds selection method based on Morphology The seeds are extracted from the inner boundaries of image objects and hided in the luminance channel using LSB method   The Journal of Industrial and Engineering Chemistry ,1922   Digest of Technical Papers ,1972   **Journal of Industrial and Engineering Chemistry** ,1922   **The American Architect Specification Manual** ,1928   **Pesticides Monitoring Journal** ,1976   *Advanced Materials & Processes* ,1989-07   **Child Development** ,1930   **Better Homes and Gardens** ,1928
