Statistical Models Based On Counting Processes:

Statistical Models Based on Counting Processes PER KRAGH ANDERSEN, Ornulf Borgan, Richard D. Gill, Niels Keiding, 1996-12-20 Modern survival analysis and more general event history analysis may be effectively handled within the mathematical framework of counting processes This book presents this theory which has been the subject of intense research activity over the past 15 years The exposition of the theory is integrated with careful presentation of many practical examples drawn almost exclusively from the authors own experience with detailed numerical and graphical illustrations Although Statistical Models Based on Counting Processes may be viewed as a research monograph for mathematical statisticians and biostatisticians almost all the methods are given in concrete detail for use in practice by other mathematically oriented researchers studying event histories demographers econometricians epidemiologists actuarial mathematicians reliability engineers and biologists Much of the material has so far only been available in the journal literature if at all and so a wide variety of researchers will find this an invaluable survey of the subject

□□□□□□□□□□, 1998 The aim of the book is to present a theory for handling such statistical problems when observation is assumed to happen in continuous time In most of the book a minimum of assumptions are made non and semiparametric theory although one chapter considers parametric models

Hosmer, Jr.,Stanley Lemeshow,1999-01-21 A Practical Up To Date Guide To Modern Methods In The Analysis Of Time To Event Data The rapid proliferation of powerful and affordable statistical software packages over the past decade has inspired the development of an array of valuable new methods for analyzing survival time data Yet there continues to be a paucity of statistical modeling guides geared to the concerns of health related researchers who study time to event data This book helps bridge this important gap in the literature Applied Survival Analysis is a comprehensive introduction to regression modeling for time to event data used in epidemiological biostatistical and other health related research Unlike other texts on the subject it focuses almost exclusively on practical applications rather than mathematical theory and offers clear accessible presentations of modern modeling techniques supplemented with real world examples and case studies While the authors emphasize the proportional hazards model descriptive methods and parametric models are also considered in some detail Key topics covered in depth include Variable selection Identification of the scale of continuous covariates The role of interactions in the model Interpretation of a fitted model Assessment of fit and model assumptions Regression diagnostics Recurrent event models frailty models and additive models Commercially available statistical software and getting the most out of it Applied Survival Analysis is an ideal introduction for graduate students in biostatistics and epidemiology as well as researchers in health related fields **Mathematical Methods of Statistics** ,2003 **Permutation Tests** Phillip I. Maller,Xian Zhou,1996 The aim of this book is to suggest and exemplify a systematic methodology for analysing survival data which contains immune or cured individuals denoted generically as long term survivors Such data occurs in medical and epidemiological applications where the intention may be to identify whether or not cured or immune individuals are present in a population perhaps as a result of treatments given in the analysis of recidivism data in criminology where the intentions are similar with respect to prisoners released from and possibly returning to prison and in many other areas where followup data is available on individuals with the possibility that not all suffer the event under investigation Both nonparametric and parametric methods are proposed and developed The effects of covariate information can be assessed via a kind of generalised linear framework in the parametric analyses The proposed methodologies are supported by asymptotic analyses and simulations of real situations While these theoretical underpinnings are presented in reasonable rigour and detail the book is aimed very much at the practitioner who wishes to analyse survival data with or even without immunes **Statistics in the Environmental & Earth Sciences** Andrew T.
