VLSI Signal Processing, IV Howard S. Moscovitz, Kung Yao, Rajeev Jain, 1991 VLSI Signal Processing Peter B. Denyer, David Renshaw, 1985 **VLSI DIGITAL SIGNAL PROCESSING SYSTEMS: DESIGN AND IMPLEMENTATION** Keshab K. Parhi, 2007 Market_Desc Students in graduate level courses Electrical Engineers Computer Scientists Computer Architecture Designers Circuit Designers Algorithm Designers System Designers Computer Programmers in the Multimedia and Wireless Communications Industries VLSI System Designers Special Features This example packed resource provides invaluable professional training for a rapidly expanding industry Presents a variety of approaches to analysis estimation and reduction of power consumption in order to help designers extend battery life Includes application driven problems at the end of each chapter Features six appendices covering shortest path algorithms used in retiming scheduling and allocation techniques as well as determining the iteration bound The Author is a recognized expert in the field having written several books taught several graduate level classes and served on several IEEE boards About The Book This book complements the other Digital Signaling Processing books in our list which include an introductory treatment Marven a comprehensive handbook Mitra a professional reference Kaloupsidis and others which pertain to a specific topic such as noise control This graduate level textbook will fill an important niche in a rapidly expanding market VLSI Signal Processing Technology Magdy A. Bayoumi, E. Swartzlander, 2012-12-06 This book is the first in a set of forthcoming books focussed on state of the art development in the VLSI Signal Processing area It is a response to the tremendous research activities taking place in that field These activities have been driven by two factors the dramatic increase in demand for high speed signal processing especially in consumer elec tronics and the evolving microelectronic technologies The available technology has always been one of the main factors in determining al gorithms architectures and design strategies to be followed With every new technology signal processing systems go through many changes in concepts design methods and implementation The goal of this book is to introduce the reader to the main features of VLSI Signal Processing and the ongoing developments in this area The focus of this book is on Current developments in Digital Signal Processing DSP pro cessors and architectures several examples and case studies of existing DSP chips are discussed in Chapter 1 Features and requirements of image and video signal processing architectures both applications specific integrated circuits ASICs and programmable image processors are studied in Chapter 2 New market areas for signal processing especially in consumer electronics such as multimedia teleconferencing and movie on demand Impact of arithmetic circuitry on the performance of DSP pro cessors several topics are discussed in Chapter 3 such as number representation arithmetic algorithms and circuits and implementa tion VLSI Signal Processing, VI IEEE Acoustics, Speech, and Signal Processing Society, 1993 **VLSI Design Methodologies for Digital Signal Processing Architectures** Magdy A. Bayoumi, 2012-12-06 Designing VLSI systems represents a challenging task It is a transfonnation among different specifications corresponding to different levels of design abstraction behavioral

structural and physical The behavioral level describes the functionality of the design It consists of two components static and dynamic The static component describes operations whereas the dynamic component describes sequencing and timing The structural level contains information about components control and connectivity The physical level describes the constraints that should be imposed on the floor plan the placement of components and the geometry of the design Constraints of area speed and power are also applied at this level To implement such multilevel transformation a design methodology should be devised taking into consideration the constraints limitations and properties of each level The mapping process between any of these domains is non isomorphic A single behavioral component may be transformed into more than one structural component Design methodologies are the most recent evolution in the design automation era which started off with the introduction and subsequent usage of module generation especially for regular structures such as PLA s and memories A design methodology should offer an integrated design system rather than a set of separate unrelated routines and tools A general outline of a desired integrated design system is as follows Decide on a certain unified framework for all design levels Derive a design method based on this framework Create a design environment to implement this design method

Asynchronous Circuit Design for VLSI Signal Processing is a collection of research papers on recent advances in the area of specification design and analysis of asynchronous circuits and systems This interest in designing digital computing systems without a global clock is prompted by the ever growing difficulty in adopting global synchronization as the only efficient means to system timing Asynchronous circuits and systems have long held interest for circuit designers and researchers alike because of the inherent challenge involved in designing these circuits as well as developing design techniques for them The frontier research in this area can be traced back to Huffman s publications *The Synthesis of Sequential Switching Circuits* in 1954 followed by Unger s book *Asynchronous Sequential Switching Circuits* in 1969 where a theoretical foundation for handling logic hazards was established In the last few years a growing number of researchers have joined force in unveiling the mystery of designing correct asynchronous circuits and better yet have produced several alternatives in automatic synthesis and verification of such circuits This collection of research papers represents a balanced view of current research efforts in the design synthesis and verification of asynchronous systems *VLSI Signal Processing* Peter R.
