

The steady-state theory is a cosmological model proposing that the universe has no beginning or end and maintains a constant density through continuous matter creation. Developed in 1948 by Fred Hoyle, Hermann Bondi, and Thomas Gold, it contrasts with the Big Bang theory, which suggests a singular origin. The steady-state model relies on the Perfect Cosmological Principle, stating that the universe appears the same at all times and locations. However, discoveries like cosmic microwave background radiation (CMB) and evolving galaxy distributions led to its decline, with most scientists favoring the Big Bang model today.
