for the Time-Varying Volume Data Tzi-Cker Chiueh, Institute for Computer Applications in Science and Engineering, 1997

Abstract This paper presents a strategy for efficiently rendering time varying volume data sets on a distributed memory parallel computer Time varying volume data take large storage space and visualizing them requires reading large files continuously or periodically throughout the course of the visualization process Instead of using all the processors to collectively render one volume at a time a pipelined rendering process is formed by partitioning processors into groups to render multiple volumes concurrently In this way the overall rendering time may be greatly reduced because the pipelined rendering tasks are overlapped with the I O required to load each volume into a group of processors moreover parallelization overhead may be reduced as a result of partitioning the processors We modify an existing parallel volume renderer to exploit various levels of rendering parallelism and to study how the partitioning of processors may lead to optimal rendering performance Two factors which are important to the overall execution time are resource utilization efficiency and pipeline startup latency The optimal partitioning configuration is the one that balances these two factors Tests on Intel Paragon computers show that in general optimal partitionings do exist for a given rendering task and result in 40 50% saving in overall rendering time Virtual Environments ,1998
