

Singularities in Fluid Dynamics and their Resolution

H.K. Moffatt
(CIME Lecturer)

Abstract Three types of singularity that can arise in fluid dynamical problems will be distinguished and discussed. These are: (i) singularities driven by boundary motion in conjunction with viscosity (e.g. corner singularities, or the Euler-disc finite-time singularity); (ii) free-surface (cusp) singularities associated with surface-tension and viscosity; (iii) interior point singularities of vorticity associated with intense vortex stretching. The singularities of types (i) and (ii) are now well known, and mechanisms by which the singularities may be resolved are clear. The question of existence of singularities of type (iii) is still open; current evidence for and against will be discussed.

1 Introduction

This paper is concerned with some examples of singularities, i.e. unbounded local behaviour of the velocity field or its derivatives, in the flow of an incompressible fluid, and the manner in which such singularities must in practice be resolved. Singularities may be associated with the geometry of the fluid boundary or with some singular feature of the motion of the boundaries; they may arise spontaneously at a free surface as a result of viscous stresses and despite the smoothing action of surface tension; or they may conceivably occur at interior points of a fluid due to unbounded vortex stretching at high (or infinite) Reynolds number. In the last case, we are up against the unsolved and extremely challenging ‘finite-time-singularity’ problem for the Euler and/or Navier-Stokes equations. The question of existence of finite-time singularities is still open. Solution of this problem would have far-reaching
