[Bootstrapping Trust in Modern Computers](#) Bryan Parno,Jonathan M. McCune,Adrian Perrig,2011-08-27 Trusting a computer for a security sensitive task such as checking email or banking online requires the user to know something about the computer s state We examine research on securely capturing a computer s state and consider the utility of this information both for improving security on the local computer e g to convince the user that her computer is not infected with malware and for communicating a remote computer s state e g to enable the user to check that a web server will adequately protect her data Although the recent Trusted Computing initiative has drawn both positive and negative attention to this area we consider the older and broader topic of bootstrapping trust in a computer We cover issues ranging from the wide collection of secure hardware that can serve as a foundation for trust to the usability issues that arise when trying to convey computer state information to humans This approach unifies disparate research efforts and highlights opportunities for additional work that can guide real world improvements in computer security

Annual ACM Symposium on Principles of Distributed Computing** ,2003 *Proceedings of the Twenty-Second Annual ACM Symposium on Principles of Distributed Computing* ,2003 This paper presents an efficient asynchronous protocol to compute RSA inverses with respect to a public RSA modulus N whose factorization is secret and shared among a group of parties Given two numbers x and e the protocol computes y such that $ye \equiv x \pmod{N}$ A synchronous protocol for this task has been presented by Catalano Gennaro and Halevi Eurocrypt 2000 but the standard approach for turning this into an asynchronous protocol would require a Byzantine agreement sub protocol Our protocol adopts their approach but exploits a feature of the problem in order to avoid the use of a Byzantine agreement primitive Hence it leads to efficient asynchronous protocols for threshold signatures and for Byzantine agreement based on the strong RSA assumption without the use of random oracles
