

HOW TO ASSESS THE WELDABILITY OF MATERIALS

SOLIDIFICATION CRACKING

Low-alloy steels, austenitic stainless steel, and aluminum are prone to solidification cracking. A circular patch test can determine the susceptibility of low-alloy steels and aluminum. This test involves positioning the test material at a constant distance from the test patch with a large restraining plate and welding between the patch and plate around the circumference of the patch.

HYDROGEN CRACKING

There are a number of testing methods available to test the susceptibility of a material to hydrogen cracking. For example, Tekken or Y-groove tests are suitable for evaluating the heat-affected zone (HAZ) for hydrogen cracking, while controlled thermal severity tests are suitable for restrained filler weld testing applications.

LAMELLAR TEARING

Testing for susceptibility for lamellar tearing involves evaluating the inclusion content and type in the parent plate.

REHEAT CRACKING

While there are no standard testing processes for determining the susceptibility of a material to reheat cracking, metallurgical professionals have proposed several potential methods (e.g., weld metal and HAZ tests).

Weldability Of Materials:

Weldability of Materials R. Alan Patterson, Kim Walker Mahin, 1990 **Theory of Weldability of Metals and Alloys** Ivan Hrivňák, 1992 This book reviews the behaviour of metals and alloys during welding In the first part the heat flow in arc welding processes is discussed The weld thermal cycle is explained in terms of heat input and the geometry of weld and thicknesses to be welded The real welding cycle is described in terms of thermal and strain cycles The weld metal is characterized in terms of fusion stage absorption of gases and stage of metal crystallization and structural transformation The metallurgical background of cracking is described by a full set of crackability tests along with the evaluation of metals from the point of view of crackability Post welding heat treatment is reviewed and includes the relaxation of stresses induced by welding Guidelines are given for the selection of steels for welded structures Several chapters examine the weldability of particular steels including high strength steels stainless steels high alloyed steels cryogenic steels and other metals and alloys The theories are quantified in the form of calculations or computing programmes Readers will find sufficient data for software processing
