Smart Structures A. V. Srinivasan, D. Michael McFarland, 2001 Smart structures and structural components have unusual abilities they can sense a change in temperature pressure or strain diagnose a problem and initiate an appropriate action in order to preserve structural integrity and continue to perform their intended functions Smart structures can also store processes in memory and learn to repeat the actions taken Among the many applications are aircraft sensors that warn of impending cracks and medical devices that monitor blood sugar and deliver insulin This text provides the basic information needed to analyze and design smart devices and structures Among topics covered are piezoelectric crystals shape memory alloys electrorheological fluids vibration absorbers fiber optics and mistuning A final chapter offers an intriguing view of biomimetics and design strategies that can be incorporated at the microstructural level deriving inspiration from biological structures The design of smart structures is at the cutting edge of engineering research and development and there is a great need for an introductory book on the subject This book will be welcomed by both students and practising engineers

Modeling, Analysis and Design of SMART Composite Structures and Curved Actuators, 2001 A general framework has been developed for the analysis of laminated smart structures with embedded and or surface bonded piezoelectric actuators and sensors The theory addresses the following issues 1 accurate description of transverse shear effect in the laminated structural model 2 presence of multiple delaminations and 3 characterization of delamination placement and size on dynamic characteristics The mathematical model

has been implemented using finite element method and extensive numerical investigations have been performed to validate the model with three dimensional results and available experimental data Results indicate that the presence of delaminations affect the modal strain distributions in smart composite laminates The developed theory has been used to characterize delaminations in smart composite plates of arbitrary thickness and results indicate that dynamic strain is a better indicator of damage than frequencies or mode shapes Significant differences are noted in the RMS values of the response calculated using modal strain indicating the presence of damage A control system has also been designed to minimize the effect of damage New damage indices based on modal strain are proposed and show promising results
