Do Workplace Smoking Bans Reduce Smoking? William N. Evans, Matthew C. Farrelly, Edward Montgomery, 1996 In recent years there has been a heightened public concern over the potentially harmful effects of environmental tobacco smoke ETS In response smoking has been banned on many jobs Using data from the 1991 and 1993 National Health Interview Survey and smoking supplements to the September 1992 and May 1993 Current Population Survey we investigate whether these workplace policies reduce smoking prevalence and smoking intensity among workers Our estimates suggest that workplace bans reduce smoking prevalence by 5 percentage points and average daily consumption among smokers by 10 percent The impact of the ban is greatest for those with longer work weeks Although workers with better health habits are more likely to work at establishments with workplace smoking bans estimates from bivariate probit and two stage least square equations suggest that these estimates are not subject to an omitted variables bias The rapid increase in workplace bans can explain all of the recent sharp fall in smoking among workers relative to non workers  
Secondhand Smoke Exposure and Cardiovascular Effects Institute of Medicine, Board on Population Health and Public Health Practice, Committee on Secondhand Smoke Exposure and Acute Coronary Events, 2010-02-21 Data suggest that exposure to secondhand smoke can result in heart disease in nonsmoking adults Recently progress has been made in reducing involuntary exposure to secondhand smoke through legislation banning smoking in workplaces restaurants and other public places The effect of legislation to ban smoking and its effects on the cardiovascular health of nonsmoking adults however remains a question Secondhand Smoke Exposure and Cardiovascular Effects reviews available scientific literature to assess the relationship between secondhand smoke exposure and acute coronary events The authors experts in secondhand smoke exposure and toxicology clinical cardiology epidemiology and statistics find that there is about a 25 to 30 percent increase in the risk of coronary heart disease from exposure to secondhand smoke Their findings agree with the 2006 Surgeon General s Report conclusion that there are increased risks of coronary heart disease morbidity and mortality among men and women exposed to secondhand smoke However the authors note that the evidence for determining the magnitude of the relationship between

chronic secondhand smoke exposure and coronary heart disease is not very strong Public health professionals will rely upon *Secondhand Smoke Exposure and Cardiovascular Effects* for its survey of critical epidemiological studies on the effects of smoking bans and evidence of links between secondhand smoke exposure and cardiovascular events as well as its findings and recommendations Text Retrieval Conference, 4th D.
