Evolutionary Relationships among Rodents W. Patrick Luckett, Jean-Louis Hartenberger, 2013-11-11 The order Rodentia is the most abundant and successful group of mammals and it has been a focal point of attention for comparative and evolutionary biologists for many years In addition rodents are the most commonly used experimental mammals for bio medical research and they have played a central role in investigations of the genetic and molecular mechanisms of speciation in mammals During recent decades a tremendous amount of new data from various aspects of the biology of living and fossil rodents has been accumulated by specialists from different disciplines ranging from molecular biology to paleontology Paradoxically our understanding of the possible evolutionary relationships among different rodent families as well as the possible affinities of rodents with other eutherian mammals has not kept pace with this information explosion This abundance of new biological data has not been incorporated into a broad synthesis of rodent phylogeny in part because of the difficulty for any single student of rodent evolution to evaluate the phylogenetic significance of new findings from such diverse disciplines as paleontology embryology comparative anatomy molecular biology and cytogenetics The origin and subsequent radiation of the order Rodentia were based primarily on the acquisition of a key character complex specializations of the incisors cheek teeth and associated musculoskeletal features of the jaws and skull for gnawing and chewing
