Moerman, 1971 This book was originally published as a doctoral thesis and was defended by the author at the Tilburg School of Economics in 1969 It has the characteristics of a work on industrial econometrics On the one hand relevant economical statistical and mathematical theory is treated and on the other a model for a very actual situation has been created and utilised to solve a practical problem The selection from current reference material always has a personal tinge of course and other theoreticians will find some of the author's departures from the theme a little unnecessary However if the theory propounded in this book is tested for its relevance in solving practical problems the selection may be regarded as a success Thanks to the way in which the case is developed the book is of great practical use So often in writings on operations research theory is applied to so called practical examples which in fact can only be described as five finger exercises It is clear from the early chapters that the author has struggled with this problem but that he has found a solution And in his concluding remarks he indicates briefly how this case can be incorporated in a context which goes beyond short term optimisation In the description of the preparatory and implementation phases the author shows how a clash between practical implementation and theoretical application can successfully be avoided in this preparatory work **Journal of Statistical Planning and Inference**, 1993 **Aeromedical Support Issues in Contingency Operations**, 1998
