Division of Applied Mathematics Ulf Grenander,Ulf Grenander,2017-10-28 Excerpt from Statistical Analysis of Stationary Time Series These schemes have been important in the development of methods for the statistical analysis of time series They have been used with a varying degree of success to describe many types of phenomena encountered in applications From the discussion in Chapter 1 it Will be apparent that by using these schemes it is possible to approximate a large and important class of stationary processes Viz The so called linear processes see For this to be possible p must take large rather than small values and para meters involved in the scheme must be adjusted adequately During the last ten years a good deal of work has been devoted to the construction of tests estimates and confidence intervals appropriate for these schemes We have described a few of the more important of these results in Chapter 3 In spite of the ingenuity and great theoretical interest of some of these methods their practical applicability seems to be limited severely by the assumption that the process is a low usually zero first or second order finite parameter scheme After surveying a good deal of the applied literature devoted to statistical analysis of time series met with in practice we have come to the following conclusion About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books Find more at www.forgottenbooks.com This book is a reproduction of an important historical work Forgotten Books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy In rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition We do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

Time Series Daniil Ryabko,2019-03-07 Stationarity is a very general qualitative assumption that can be assessed on the basis of application specifics It is thus a rather attractive assumption to base statistical analysis on especially for problems for which less general qualitative assumptions such as independence or finite memory clearly fail However it has long been considered too general to be able to make statistical inference One of the reasons for this is that rates of convergence even of frequencies to the mean are not available under this assumption alone Recently it has been shown that while some natural and simple problems such as homogeneity are indeed provably impossible to solve if one only assumes that the data is stationary or stationary ergodic many others can be solved with rather simple and intuitive algorithms The latter include

clustering and change point estimation among others In this volume these results are summarize The emphasis is on asymptotic consistency since this the strongest property one can obtain assuming stationarity alone While for most of the problem for which a solution is found this solution is algorithmically realizable the main objective in this area of research the objective which is only partially attained is to understand what is possible and what is not possible to do for stationary time series The considered problems include homogeneity testing the so called two sample problem clustering with respect to distribution clustering with respect to independence change point estimation identity testing and the general problem of composite hypotheses testing For the latter problem a topological criterion for the existence of a consistent test is presented In addition a number of open problems is presented
