System Identification Torsten Söderström, Petre Stoica, 1989 A textbook designed for senior undergraduate and graduate level classroom courses on system identification Examples and problems Annotation copyrighted by Book News Inc Portland OR

System Identification Karel J. Keesman, 2011-05-16 *System Identification* shows the student reader how to approach the system identification problem in a systematic fashion The process is divided into three basic steps experimental design and data collection model structure selection and parameter estimation and model validation each of which is the subject of one or more parts of the text Following an introduction on system theory particularly in relation to model representation and model properties the book contains four parts covering data based identification non parametric methods for use when prior system knowledge is very limited time invariant identification for systems with constant parameters time varying systems identification primarily with recursive estimation techniques and model validation methods A fifth part composed of appendices covers the various aspects of the underlying mathematics needed to begin using the text The book uses essentially semi physical or gray box modeling methods although data based transfer function system descriptions are also introduced The approach is problem based rather than rigorously mathematical The use of finite input output data is demonstrated for frequency and time domain identification in static dynamic linear nonlinear time invariant and time varying systems Simple examples are used to show readers how to perform and emulate the identification steps involved in various

control design methods with more complex illustrations derived from real physical chemical and biological applications being used to demonstrate the practical applicability of the methods described End of chapter exercises for which a downloadable instructors Solutions Manual is available from fill in URL here will both help students to assimilate what they have learned and make the book suitable for self tuition by practitioners looking to brush up on modern techniques Graduate and final year undergraduate students will find this text to be a practical and realistic course in system identification that can be used for assessing the processes of a variety of engineering disciplines System Identification will help academic instructors teaching control related to give their students a good understanding of identification methods that can be used in the real world without the encumbrance of undue mathematical detail

Identification of Dynamic Systems Rolf Isermann,Marco Münchhof,2014-11-23 Precise dynamic models of processes are required for many applications ranging from control engineering to the natural sciences and economics Frequently such precise models cannot be derived using theoretical considerations alone Therefore they must be determined experimentally This book treats the determination of dynamic models based on measurements taken at the process which is known as system identification or process identification Both offline and online methods are presented i e methods that post process the measured data as well as methods that provide models during the measurement The book is theory oriented and application oriented and most methods covered have been used successfully in practical applications for many different processes Illustrative examples in this book with real measured data range from hydraulic and electric

actuators up to combustion engines Real experimental data is also provided on the Springer webpage allowing readers to gather their first experience with the methods presented in this book Among others the book covers the following subjects determination of the non parametric frequency response fast Fourier transform correlation analysis parameter estimation with a focus on the method of Least Squares and modifications identification of time variant processes identification in closed loop identification of continuous time processes and subspace methods Some methods for nonlinear system identification are also considered such as the Extended Kalman filter and neural networks The different methods are compared by using a real three mass oscillator process a model of a drive train For many identification methods hints for the practical implementation and application are provided The book is intended to meet the needs of students and practicing engineers working in research and development design and manufacturing

System Identification with MATLAB. Linear Models Marvin L., 2016-10-23 In System Identification Toolbox software MATLAB represents linear systems as model objects Model objects are specialized data containers that encapsulate model data and other attributes in a structured way Model objects allow you to manipulate linear systems as single entities rather than keeping track of multiple data vectors matrices or cell arrays Model objects can represent single input single output SISO systems or multiple input multiple output MIMO systems You can represent both continuous and discrete time linear systems The toolbox provides several linear and nonlinear black box model structures

which have traditionally been useful for representing dynamic systems This book develops the next tasks with linear models

Identification Des Systèmes Pour Le Développement Intégré Des Aéronefs Et Les Essais en Vol, 1999 Block-oriented Nonlinear System Identification Fouad Giri, Er-Wei Bai, 2010-08-18 Block oriented Nonlinear System Identification deals with an area of research that has been very active since the turn of the millennium The book makes a pedagogical and cohesive presentation of the methods developed in that time These include iterative and over parameterization techniques stochastic and frequency approaches support vector machine subspace and separable least squares methods blind identification method bounded error method and decoupling inputs approach The identification methods are presented by authors who have either invented them or contributed significantly to their development All the important issues e g input design persistent excitation and consistency analysis are discussed The practical relevance of block oriented models is illustrated through biomedical physiological system modelling The book will be of major interest to all those who are concerned with nonlinear system identification whatever their activity areas This is particularly the case for educators in electrical mechanical chemical and biomedical engineering and for practising engineers in process aeronautic aerospace robotics and vehicles control Block oriented Nonlinear System Identification serves as a reference for active researchers new comers industrial and education practitioners and graduate students alike

Errors-in-Variables Methods in System Identification Torsten Söderström, 2018-04-07 This book presents an overview of the different errors in variables EIV methods that can be used for system identification Readers will explore the properties of an EIV problem Such problems play an important role when the purpose is the determination of the physical laws that describe the process rather than the prediction or control of its future behaviour EIV problems typically occur when the purpose of the modelling is to get physical insight into a process Identifiability of the model parameters for EIV problems is a non trivial issue and sufficient conditions for identifiability are given The author covers various modelling aspects which taken together can find a solution including the characterization of noise properties extension to multivariable systems and continuous time models The book finds solutions that are constituted

of methods that are compatible with a set of noisy data which traditional approaches to solutions such as total least squares do not find A number of identification methods for the EIV problem are presented Each method is accompanied with a detailed analysis based on statistical theory and the relationship between the different methods is explained A multitude of methods are covered including instrumental variables methods methods based on bias compensation covariance matching methods and prediction error and maximum likelihood methods The book shows how many of the methods can be applied in either the time or the frequency domain and provides special methods adapted to the case of periodic excitation It concludes with a chapter specifically devoted to practical aspects and user perspectives that will facilitate the transfer of the theoretical material to application in real systems

Errors in Variables Methods in System Identification gives readers the possibility of recovering true system dynamics from noisy measurements while solving over determined systems of equations making it suitable for statisticians and mathematicians alike The book also acts as a reference for researchers and computer engineers because of its detailed exploration of EIV problems
