

1. Introduction :

La commande numérique a pour objet principal l'utilisation de calculateurs numériques en temps réel pour commander, piloter ou guider des processus physiques qui sont le plus souvent à temps continu.

Ces machines numériques sont capables de calculer en temps réel les paramètres adéquats à appliquer à la commande du système, en fonction de son évolution.

La figure ci-dessous montre le schéma-bloc type d'un système à commande numérique :

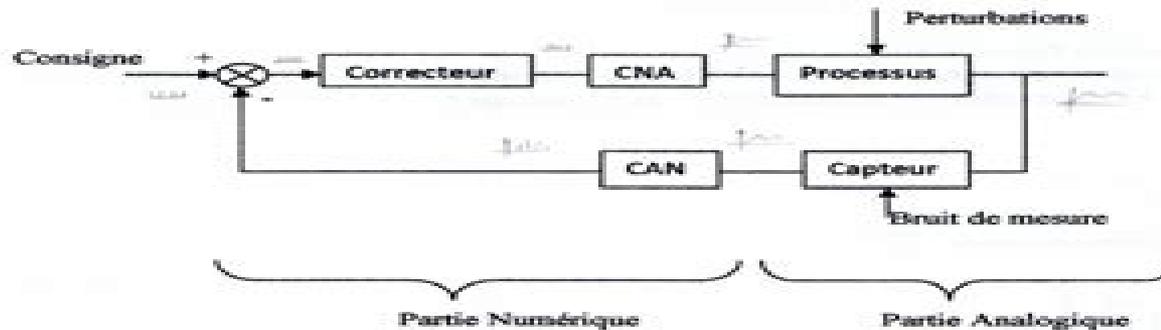

Fig. 1 Système à commande numérique.

Le processus et un certain nombre de composants (capteur, actionneur ...) restent de type analogique, et l'introduction d'ordinateurs ou processeurs pour commander un système nécessite la mise en œuvre d'une interface entre le calculateur et le procédé. Ceci est obtenu à l'aide d'un Convertisseur Analogique-Numérique (CAN) transmettant au processeur les mesures acquises sur le procédé par le système de mesure, ou réciproquement Numérique-Analogique (CNA) permettant d'envoyer les ordres du processeur vers l'actionneur du processus.

Cependant, un processeur numérique traite des valeurs numériques (des nombres) plutôt que des valeurs analogiques, d'où la nécessité de l'échantillonnage (réalisé par le CAN) qui joue un rôle capital en commande numérique et qui consiste à remplacer un signal analogique par une suite de ses valeurs prises à des instants bien définis.
