Systolic Algorithms:

Systolic Algorithms David J. Evans, 1991-01-01 While the architecture of present day parallel supercomputers is largely based on the concept of a shared memory with its attendant limitations of common access advances in semiconductor technology have led to the development of highly parallel computer architectures with decentralized storage and limited connections in which each processor possesses high bandwidth local memory connected to a small number of such architectures enabling cost effective high speed parallel processing for large volumes of data with ultra high throughput rates Algorithms suitable for implementation on systolic arrays find applications in areas such as signal and image processing pattern matching linear algebra recurrence algorithms and graph problems This book provides an insight into the implementation of systolic arrays and gives a comprehensive overview of the techniques and theories contributing to the design of systolic algorithms

Systolic Computations M.A. Frumkin, 2012-12-06 This monograph is devoted to a new method of parallel computing which uses VLSI technology in an efficient manner By this method data are fed to the cells of a systolic processor and results are obtained instantly Some theoretical and algorithmic questions which arise in the design of hardware and software for systolic processing are considered Special attention is devoted to the complexity of VLSI complexity of algorithms parallel algorithms relations between graphs of algorithms and graphs of processors parallel programming languages and the use of systolic algorithms for vector programming The book is unique for its inclusion of a library of systolic algorithms for solving problems from twelve branches of computer science and will be useful for designers of hardware and software for parallel processing

Systolic Algorithms & Architectures Patrice Quinton, Yves Robert, 1991 A survey of systolic algorithms this volume also covers systolic architecture and automatic synthesis methodologies for the design of systolic arrays Exercises are included

An Introduction to Systolic Algorithm Design G. M. Megson, 1992 Parallel programming and the effective exploitation of parallel computers will play an increasingly important part in the future development of computer systems Systolic processing is a technique for solving problems on a massively parallel computer architecture in a way that pumps information or data between processing elements in a regular and rhythmic pattern This book is an introduction to the basic principles of systolic design explaining what systolic algorithms are and showing how to design systolic arrays in a systematic way so that they meet certain design objectives such as area and time efficiency These topics are addressed by underlining the distinction between the two concepts with systolic algorithms being constrained by basic axioms of systolic design while systolic arrays are seen as dependent on heuristics defining the limitations of manufacturing technology The text is based on the author's extensive experience with the design of systolic algorithms and his familiarity with teaching the subject to those with little or no background in parallel processing It is intended for graduate students and professionals in the fields of computer science and engineering

Systolic Parallel Processing N. Petkov, 1993 This work emphasizes the significance of systolic algorithms for massively parallel computing It presents using a unified representation form a collection of important systolic algorithms for various problems linear algebra linear filters operations with polynomials comparison problems with some applications to non linear filtering and data structures dynamic programming and computational geometry Design principles and techniques are given and illustrated with concrete examples The book is also concerned with the results achieved in the past decade in different methodologies for systematic design efficiency improvement and partitioning of systolic algorithms In this respect systolic algorithms still have a unique position among parallel algorithms in that only this kind of algorithm has mature systematic design techniques The most important theoretical results achieved in systolic array research are concentrated in Chapter 2 definitions Chapter 11 systematic design and Chapter 12 partitioning The different efficiency improvement techniques are presented when treating concrete algorithms It should be of great interest to researchers involved in computer science and electrical and computer engineering and to producers of high performance computers in particular of massively parallel computers

Kwon, 2014-05-23 This Workshop focuses on such issues as control algorithms which are suitable for real time use computer architectures which are suitable for real time control algorithms and applications for real time control issues in the areas of parallel algorithms multiprocessor systems neural networks fault tolerance systems real time robot control identification real time filtering algorithms control algorithms fuzzy control adaptive and self tuning control and real time control applications

Occam and the Transputers, Current Developments World Occam and Transputer User Group. Technical Meeting, 1991 Examines applications of transputers and OCCAM including numerical image processing neural networks natural language processing networks and biological systems as well as tools routing and mapping The T9000 new generation transputer introduction is further discussed Matrix Computations on Systolic-Type Arrays Jaime Moreno, Tomás Lang, 2012-12-06 Matrix Computations on Systolic Type Arrays provides a framework which permits a good understanding of the features and limitations of processor arrays for matrix algorithms It describes the

tradeoffs among the characteristics of these systems such as internal storage and communication bandwidth and the impact on overall performance and cost A system which allows for the analysis of methods for the design mapping of matrix algorithms is also presented This method identifies stages in the design mapping process and the capabilities required at each stage Matrix Computations on Systolic Type Arrays provides a much needed description of the area of processor arrays for matrix algorithms and of the methods used to derive those arrays The ideas developed here reduce the space of solutions in the design mapping process by establishing clear criteria to select among possible options as well as by a priori rejection of alternatives which are not adequate but which are considered in other approaches The end result is a method which is more specific than other techniques previously available suitable for a class of matrix algorithms but which is more systematic better defined and more effective in reaching the desired objectives Matrix Computations on Systolic Type Arrays will interest researchers and professionals who are looking for systematic mechanisms to implement matrix algorithms either as algorithm specific structures or using specialized architectures It provides tools that simplify the design mapping process without introducing degradation and that permit tradeoffs between performance cost measures selected by the designer

F. Ipsen, YALE UNIV NEW HAVEN CT DEPT OF COMPUTER SCIENCE., 1987 The most popular method for the solution of linear systems of equations with Toeplitz coefficient matrix on a single processor is Levinson's algorithm whose intermediate vectors form the Cholesky factor of the inverse of the Toeplitz matrix However Levinson's method is not amenable to efficient parallel implementation In contrast use of the Schur algorithm whose

intermediate vectors form the Cholesky factor of the Toeplitz matrix proper makes it possible to perform the entire solution procedure on one processor array in time linear in the order of the matrix By means of the Levinson recursions we will show that all three phases of the Toeplitz system solution process factorisation forward elimination and backsubstitution can be based on Schur recursions This increased exploitation of the Toeplitz structure then leads to more efficient parallel implementations on systolic arrays

Algorithms and Parallel VLSI Architectures II Patrice Quinton, Yves Robert, 1992 Since the emergence of VLSI the relationship between the development of parallel algorithms and the design of special purpose architecture has always been of major concern The analysis of this relationship is the main topic of this book Hardware and software issues closely depend upon one another and cannot be solved independently Beyond the natural complexity of algorithm design the designer has to face that of choosing the appropriate technology medium for its efficient realization The dramatic developments in VLSI technology now offers extraordinary opportunities for implementing complex applications As application specific systems can offer 100 to 1000 fold improvements in cost performance over general purpose computers on applications they are attracting increasing attention in both academic and industrial communities Highly specialized application specific arrays of processors which are the targeted architectures in this book are extremely appealing The papers in this volume give a thorough overview on current research in the areas of parallel algorithms synthesis methods VLSI architectures and design tools

Fast Algorithms and Their Implementation on Specialized Parallel Computers Jozef Mikloško, 1989 Recognizing the need for a comprehensive overview of new results this book looks at the problems of creating fast numerical and nonnumerical algorithms It also contains analyses of their properties and possibilities of their efficient implementation on specialized parallel computers Instead of treating these problems separately the book deals with them in their complexity taking into account their mutual relationships Attention is paid to the following topics methods of creating fast parallel algorithms parallel algorithms for associative computers systolic algorithms and their implementation on specialized processors algorithms for pipeline and matrix processors and for multiprocessors solution of a system of linear equations on specialized computers lower time bounds for SIMD type algorithms
