quality management The involved applications of intelligence include techniques such as fuzzy sets neural networks genetic algorithms etc The book consists of classical quality management topics dealing with intelligent techniques for solving the complex quality management problems The book will serve as an excellent reference for quality managers researchers lecturers and postgraduate students in this area The authors of the chapters are well known researchers in the area of quality management

*Quality Recognition & Prediction* Shoichi Teshima,2012-06-15 The Mahalanobis Taguchi data handling and pattern recognition system is widely established built and extended from the original quality control precepts of Genichi Taguchi But the MT system is not always well understood This new book makes the system much more vivid and concrete with real life applications in a wide variety of disciplines from industry to general commerce The book offers a clear computational method to show the user how to actually apply the system to real manufacturing control problems With the renowned international industry background of the three authors and their historic ties to Genichi Taguchi this book will bring a unique insight into how to get the most benefits from the MT System The book offers an overview of pattern recognition issues and the precepts of the MT system explains the merits of the MT System and its computational methods shows how to handle data with the MT System and extract useful information provides a useful comparison of the advantages and disadvantages between traditional Artificial Intelligence systems and the MT system provides case study examples of MT Systems applications

**Taguchi Methods and Optimization for Robust Software (Digital Short Cut)** Bijay K. Jayaswal,Peter C. Patton,2007-03-01 This is the eBook version of the printed book The software industry stands on the brink of an era of dramatic change We expect the industry to continue the restructuring process already begun emerging as a much smaller number of horizontally structured firms mostly doing business with each other As software becomes highly componentized the industry will begin to resemble the automotive industry with many small firms making parts but only a few large ones assembling them into finished products Software automation in the form of application generation technology will become the norm as system analysts and other domain specialists become the new application programmers writing in specification languages Meanwhile the more talented of today s application programmers will become system programmers writing the meta compilers that will transform specification language codes into Java and C application programs It is still true that new technologies do not replace old technologies at least not at first in their infancy they merely supplement them Chapters 16 17 18 and 19 of the book Design for Trustworthy Software address the transition period during which robust trustworthy software is still created by current technology and processes as the new technology and its streamlined processes emerge This short cut is a reproduction of Chapter 17 of Design for Trustworthy Software It illustrates how Taguchi s quality loss function provides a measure of the overall loss to society when a product fails to meet its target functionality and reliability It describes how signal to noise ratio measures the positive quality contribution from controllable or design factors versus the negative quality contribution from uncontrollable or noise factors It presents Taguchi Methods

involving seven steps beginning with a clear statement of the design problem and ending with a confirming statistical experiment showing how parameter choices will enhance robustness An example from electrical circuit design is presented because it is much more similar to software design than mechanical design where Taguchi Methods have found their largest applications A more detailed example from software design or product improvement builds on the previous example Lastly this short cut describes Taguchi's development and application of an earlier technique involving Latin squares or orthogonal matrices to allow the evaluation on multiple parameters simultaneously It illustrates how his use of orthogonal matrices permits a multifactorial analysis that is far more efficient than a conventional bottleneck analysis and how it allows the study of factor interactions This short cut can be used either as an important methodology of trustworthy software design process or as a standalone presentation of Taguchi Methods in software development context This short cut should be of interest to software and quality professionals In particular it should be of value to the CMMI Six Sigma and DFSS communities worldwide especially for those who have acquired or plan to acquire Green Belt Black Belt Master Black Belt or similar competencies in various quality management disciplines It should also be useful resource for students and academics of various programs at senior undergraduate and graduate levels and for those preparing for American Society for Quality's ASQ Certified Software Quality Engineer CSQE examination
