**Collaborative Networks and Their Breeding Environments** Luis M. Camarinha-Matos, Hamideh Afsarmanesh, Angel Ortiz, 2005-08-31 Progress in collaborative networks continues showing a growing number of manifestations and has led to the acceptance of Collaborative Networks CN as a new scientific discipline Contributions to CN coming from multiple reference disciplines has been extensively investigated In fact developments in CN have benefited from contributions of multiple areas namely computer science computer engineering communications and networking management economy social sciences law and ethics etc Furthermore some theories and paradigms defined elsewhere have been suggested by several research groups as promising tools to help define and characterize emerging collaborative organizational forms Although still at the beginning of a long way to go there is a growing awareness in the research and academic world for the need to establish a stronger theoretical foundation for this new discipline and a number of recent works are contributing to this goal From a utilitarian perspective agility has been pointed out as one of the most appealing characteristics of collaborative networks to face the challenges of a fast changing socio economic context However during the last years it became more evident that finding the right partners and establishing the necessary preconditions for starting an effective collaboration process are both costly and time consuming activities and therefore an inhibitor of the aimed agility Among others obstacles include lack of information e g non availability of catalogs with normalized profiles of organizations and lack of preparedness of organizations to join the collaborative process Overcoming the mismatches resulting from the heterogeneity of potential partners e g differences in infrastructures corporate culture methods of work and business practices requires considerable investment Building trust a pre requisite for any effective collaboration is not straight forward and requires time Therefore the effective creation of truly dynamic collaborative networks requires a proper context in which potential members are prepared to rapidly get engaged in collaborative processes The concept of breeding environment has thus emerged as an important facilitator for wider dissemination of collaborative networks and their practical materialization The PRO VE 05 held in Valencia Spain continues the 6th event in a series of successful working conferences on virtual enterprises This book includes selected papers from that conference and should become a valuable tool to all of those interested in the advances and challenges of collaborative networks

Lessons from Learning Robert Lewis,Patrick Mendelsohn,1994 The last thirty years have produced a widely varying series of research experiments and innovative practices in the uses of computer and communications technologies to support teaching and learning

Relatively recently enough experience has been accumulated to justify significant investment in implementing systems across a broad range of educational and training domains Much of this experience has been pragmatic and attempts to place the activity within a substantive cognitive framework have not met with much success Lessons have been learnt from the experience but there are many complex issues of knowledge representation acquisition and long term accommodation linked to the role of human actors and technological tools This publication divides its exploration of the intricacies of the field into four key areas Theme A takes a cognitive psychologist s approach to learning processes It is concerned with the ways in which knowledge is stored or represented inside the human mind it is also concerned with knowledge acquisition and knowledge structures and their relation to learning environment design Theme B takes an educationalist s perspective of learning It takes the learner as the focus and examines learning styles teaching styles collaborative learning etc Theme C focuses on the design of learning tasks and environments with considerations of design principles of exploratory or expressive materials It is strongly domain orientated Theme D focuses on knowledge architectures as they can be created in

a machine and so includes the formalisms and models required in artificial intelligence applications to learning In addition to providing a comprehensive consideration of the problems faced and solutions so far achieved it is hoped the book will stimulate further research and funding in an area that simply cannot be ignored
