Treatise On Probability

John Maynard 1883-1946 Keynes

Treatise On Probability:

Probability John Keynes, James Zimmerhoff, 2017-07-07 A Treatise on Probability was printed by John Maynard Keynes while at Cambridge University The Treatise criticized the classical theory of probability and introduced a logical relationist theory instead Bertrand Russell the co author of Principia Mathematica described it as undoubtedly the most important work on probability that has emerged for a very long time and a book as a whole is one which it is impossible to praise too highly The Treatise is primarily philosophical in nature notwithstanding extensive mathematical formulations The Treatise presented a proposal to probability that was more subject to variation with evidence than the profoundly quantified standard version Keynes's notion of probability is that it is a rigorously logical relation between proof and hypothesis a degree of partial association Keynes's Treatise is the definitive account of the reasonable interpretation of probabilistic logic a view of probability that has been maintained by such later efforts as Carnap's Logical Foundations of Probability and E T Jaynes Probability Theory The Logic of Science Keynes saw numerical probabilities as special cases of probability that did not have to be quantifiable or even comparable

A Treatise on Probability John Maynard Keynes, 2013-09 This historic book may have numerous typos and missing text Purchasers can usually download a free scanned copy of the original book without typos from the publisher Not indexed Not illustrated 1921 edition Excerpt CHAPTER XXXIII OUTLINE OF A CONSTRUCTIVE THEORY 1 There is a great difference between the proposition It is

probable that every instance of this generalisation is true and the proposition It is probable of any instance of this generalisation taken at random that it is true The latter proposition may remain valid even if it is certain that some instances of the generalisation are false It is more likely than not for example that any number will be divisible either by two or by three but it is not more likely than not that all numbers are divisible either by two or by three The first type of proposition has been discussed in Part III under the name of Universal Induction The latter belongs to Inductive Correlation or Statistical Induction an attempt at the logical analysis of which must be my final task 2 What advocates of the Frequency Theory of Probability wrongly believe to be characteristic of all probabilities namely that they are essentially concerned not with single instances but with series of instances is I think a true characteristic of statistical induction A statistical induction either asserts the probability of an instance selected at random from a series of propositions or else it assigns the probability of the assertion that the truth frequency of a series of propositions i e the proportion of true propositions in the series is in the neighbourhood of a given value In either case it is asserting a characteristic of a series of propositions rather than of a particular proposition Whilst therefore our unit in the case of Universal Induction is a single instance which satisfies both the condition and the conclusion of our generalisation our unit in the case of Statistical Induction is not a

A Treatise on Probability John Keynes, 2014-12-10 The subject matter of this book was first broached in the brain of Leibniz who in the dissertation written in his twenty third year on the mode of electing the kings of Poland conceived of Probability as a branch of Logic A few years before un probl me in the words of Poisson propos un aust re jans niste par un homme du monde a t l origine du calcul des probabilit s In the intervening centuries the algebraical exercises in which the Chevalier de la M r interested Pascal have so far predominated in the learned world over the profounder enquiries of the philosopher into those processes of human faculty which by determining reasonable preference guide our choice that Probability is oftener reckoned with Mathematics than with Logic There is much here therefore which is novel and being novel unsifted inaccurate or deficient I propound my systematic conception of this subject for criticism and enlargement at the hand of others doubtful whether I myself am likely to get much further by waiting longer with a work which beginning as a Fellowship Dissertation and interrupted by the war has already extended over many years It may be perceived that I have been much influenced by W E Johnson G E Moore and Bertrand Russell that is to say by Cambridge which with great debts to the writers of Continental Europe yet continues in direct succession the English tradition of Locke and Berkeley and Hume of Mill and Sidgwick who in spite of their divergences of doctrine are united in a preference for what is matter of fact and have conceived their subject as a branch rather of science than of the creative imagination prose writers hoping to be understood J M KEYNES King s College CambridgeJ ai dit plus d une fois qu il faudrait une nouvelle esp ce de logique qui traiterait des degr s de Probabilit Leibniz 1 Part of our knowledge we obtain direct and part by argument The Theory of Probability is concerned with that part which we obtain by argument and it treats of the different degrees in which the results so obtained

are conclusive or inconclusive In most branches of academic logic such as the theory of the syllogism or the geometry of ideal space all the arguments aim at demonstrative certainty They claim to be conclusive But many other arguments are rational and claim some weight without pretending to be certain In Metaphysics in Science and in Conduct most of the arguments upon which we habitually base our rational beliefs are admitted to be inconclusive in a greater or less degree Thus for a philosophical treatment of these branches of knowledge the study of probability is required The course which the history of thought has led Logic to follow has encouraged the view that doubtful arguments are not within its scope But in the actual exercise of reason we do not wait on certainty or deem it irrational to depend on a doubtful argument If logic investigates the general principles of valid thought the study of arguments to which it is rational to attach some weight is as much a part of it as the study of those which are demonstrative 2 The terms certain and probable describe the various degrees of rational belief about a proposition which different amounts of knowledge authorise us to entertain All propositions are true or false but the knowledge we have of them depends on our circumstances and while it is often convenient to speak of propositions as certain or probable this expresses strictly a relationship in which they stand to a corpus of knowledge actual or hypothetical and not a characteristic of the propositions in themselves A proposition is capable at the same time of varying degrees of this relationship depending upon the knowledge to which it is related so that it is without significance to call a proposition probable unless we specify the knowledge to which we are relating it
