Solar And Interplanetary Disturbances S K Alurkar,1997-05-29 Over the last three decades a spate of solar wind observations have been made with sophisticated ground based and space borne instruments Two highly successful space missions of the Skylab and the twin spacecraft Helios 1 and 2 have amassed an invaluable wealth of information on the large scale structure of the inner heliosphere the solar and interplanetary magnetic field coronal holes interplanetary dust solar windflows etc Solar and interplanetary propagating phenomena have been extensively studied during the last two decades Very recently a new simple model based on results from a density mapping technique pioneered at Cambridge UK has been proposed which overcomes the problems faced by the existing CME driven shock theories This monograph puts together those exciting developments in the field of solar and interplanetary dynamic phenomena with their effects at times hazardous on the terrestrial environment It serves as an update and a ready reference for research students and scientists working in this field

Stone,Bruce T. Tsurutani,1985 Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 35 Violent expansions of the solar corona cause transient shock waves which propagate outward from the sun at hundreds to thousands of kilometers per second simple solar wind velocity gradients at the surface of the sun lead to high speed streams overtaking slower streams forming corotating shocks and steady state supermagnetosonic solar wind flow past objects such as the planets lead to standing bow shocks However the solar wind plasma is so hot and tenuous that charged particle Coulomb collisions produce negligible thermalization or dissipation on scale sizes less than 0.1 AU The irreversible plasma heating by these shocks is accomplished by wave particle interactions driven by plasma instabilities Hence these shocks are described as collisionless *Scientific and Technical Aerospace Reports* ,1988
