Synergetics of Measurement, Prediction and Control Igor Grabec, Wolfgang Sachse, 2012-12-06 In this monograph a statistical description of natural phenomena is used to develop an information processing system capable of modeling non linear relationships between sensory data The system based on self organized optimal preservation of empirical information applies these relationships for prediction and adaptive control This monograph is written for students scientists and engineers in academia and industry who are interested in experimental work related to the adaptive modeling of natural laws the development of sensory neural networks intelligent control synergetics and informatics No specific knowledge of advanced mathematics is presupposed Examples taken from physics engineering medicine and economics demonstrate the applicability of such intelligent systems

Computational Intelligence Christine L. Mumford, 2009-07-21 This book is about synergy in computational intelligence CI It is a collection of chapters that covers a rich and diverse variety of computer based techniques all involving some aspect of computational intelligence but each one taking a somewhat pragmatic view Many complex problems in the real world require the application of some form of what we loosely call intelligence for their solution Few can be solved by the naive application of a single technique however good it is Authors in this collection recognize the limitations of individual paradigms and propose some practical and novel ways in which different CI techniques can be combined with each other or with more traditional computational techniques to produce powerful problem solving environments which exhibit synergy i.e systems in which the whole is greater than the sum of the parts Computational intelligence is a relatively new term and there is some disagreement as to its precise definition Some practitioners limit its scope to schemes involving evolutionary algorithms neural networks fuzzy logic or hybrids of these For others the definition is a little more flexible and will include paradigms such as Bayesian belief networks multi agent systems case based reasoning and so on Generally the term has a similar meaning to the well known phrase Artificial Intelligence AI although CI is perceived more as a bottom up approach from which intelligent behaviour can emerge whereas AI tends to be studied from the top down and derive from pondering upon the meaning of intelligence These and other key issues will be discussed in more detail in Chapter 1

Deep Learning to See Alessandro Betti, Marco Gori, Stefano Melacci, 2022-04-26 The remarkable progress in computer vision over the last few years is by and large attributed to deep learning fueled by the availability of huge sets of labeled data and paired with the explosive growth of the GPU paradigm While subscribing to this view this work criticizes the supposed scientific progress in the field and proposes the investigation of vision within the framework of information based laws of nature This work poses

fundamental questions about vision that remain far from understood leading the reader on a journey populated by novel challenges resonating with the foundations of machine learning The central thesis proposed is that for a deeper understanding of visual computational processes it is necessary to look beyond the applications of general purpose machine learning algorithms and focus instead on appropriate learning theories that take into account the spatiotemporal nature of the visual signal Serving to inspire and stimulate critical reflection and discussion yet requiring no prior advanced technical knowledge the text can naturally be paired with classic textbooks on computer vision to better frame the current state of the art open problems and novel potential solutions As such it will be of great benefit to graduate and advanced undergraduate students in computer science computational neuroscience physics and other related disciplines
