Soil Development:

Soil Formation Nico van Breemen, Peter Buurman, 2007-08-20 Soils form a unique and irreplaceable essential resource for all terrestrial organisms including man. Soils form not only the very thin outer skin of the earth's crust that is exploited by plant roots for anchorage and supply of water and nutrients. Soils are complex natural bodies formed under the influence of plants, microorganisms, and soil animals, water, and air from their parent material, i.e. solid rock or unconsolidated sediments. Physically, chemically, and mineralogically, they usually differ strongly from the parent material and normally are far more suitable as a rooting medium for plants. In addition to serving as a substrate for plant growth, including crops and pasture, soils play a dominant role in the biogeochemical cycling of water, carbon, nitrogen, and other elements, influencing the chemical composition and turnover rates of substances in the atmosphere and the hydrosphere. Soils take decades to millennia to form. We tread on them and do not usually see their interior, so we tend to take them for granted. But improper and abusive agricultural management, careless land clearing, and reclamation, man-induced erosion, salinisation, and acidification, desertification, air and water pollution, and withdrawal of land for housing, industry, and transportation now destroy soils more rapidly than they can be formed.

Factors of Soil Formation Hans Jenny, 1994-01-01 Masterpiece offers a detailed discussion of the nature of the earth's terrestrial environment and a method of subdividing and studying it. 1941 edition.

Modelling Soil Development Under Global Change Peter Finke, 2024-03-14 Quantitative assessments of the effects of global change on soil development are mostly focused on soil carbon, some nutrients, pollutants, and soil water. Soil, however, is a complex entity with interacting biological, physical, and chemical processes that are rarely modelled in its entirety. Additionally, for the sake of simplicity, various soil properties are considered constants, whereas in reality they are not. Soil, as we observe it, is the resultant of many processes driven by varying boundary conditions, such as climate and organisms, including men. This is not different when we study global change; thus, modelling soil development under global change overlaps with modelling soil formation. This book gives an overview of what such a model should entail, with ample descriptions to use SoilGen, a simulation model to study pedogenesis.

Hadfield, 1919 [Treatise on Geomorphology](#), 2013-02-27 The changing focus and approach of geomorphic research suggests that the time is opportune for a summary of the state of discipline The number of peer reviewed papers published in geomorphic journals has grown steadily for more than two decades and more importantly the diversity of authors with respect to geographic location and disciplinary background geography geology ecology civil engineering computer science geographic information science and others has expanded dramatically As more good minds are drawn to geomorphology and the breadth of the peer reviewed literature grows an effective summary of contemporary geomorphic knowledge becomes increasingly difficult The fourteen volumes of this *Treatise on Geomorphology* will provide an important reference for users from undergraduate students looking for term paper topics to graduate students starting a literature review for their thesis work and professionals seeking a concise summary of a particular topic Information on the historical development of diverse topics within geomorphology provides context for ongoing research discussion of research strategies equipment and field methods laboratory experiments and numerical simulations reflect the multiple approaches to understanding Earth's surfaces and summaries of outstanding research questions highlight future challenges and suggest productive new avenues for research Our future ability to adapt

to geomorphic changes in the critical zone very much hinges upon how well landform scientists comprehend the dynamics of Earth's diverse surfaces. This Treatise on Geomorphology provides a useful synthesis of the state of the discipline as well as highlighting productive research directions that Educators and students researchers will find useful. Geomorphology has advanced greatly in the last 10 years to become a very interdisciplinary field. Undergraduate students looking for term paper topics to graduate students starting a literature review for their thesis work and professionals seeking a concise summary of a particular topic will find the answers they need in this broad reference work which has been designed and written to accommodate their diverse backgrounds and levels of understanding. Editor in Chief Prof J F Shroder of the University of Nebraska at Omaha is past president of the QGG section of the Geological Society of America and present Trustee of the GSA Foundation while being well respected in the geomorphology research community and having won numerous awards in the field. A host of noted international geomorphologists have contributed state of the art chapters to the work. Readers can be guaranteed that every chapter in this extensive work has been critically reviewed for consistency and accuracy by the World expert Volume Editors and by the Editor in Chief himself. No other reference work exists in the area of Geomorphology that offers the breadth and depth of information contained in this 14 volume masterpiece. From the foundations and history of geomorphology through to geomorphological innovations and computer modelling and the past and future states of landform science no stone has been left unturned.
