**Stratigraphy, Structure, and Mineralization in the Beaver-Tarryall Area, Park County, Colorado** Quentin Dreyer Singewald,1942 Cenozoic Stratigraphy, Structure and Mineralization in the Mojave Desert ,1986 **Stratigraphy, Structure, and Mineralization in the Beaver-Tarryall Area, Park County, Colorado** Quentin Dreyer Singewald,1942 Stratigraphy Vernon J. Hurst,1955 *Stratigraphy, Structure, and Mineralization of Kinsley Mountain, Elko County, Nevada* Bryan MacFarlane,2012 The Kinsley Mountain gold deposit of northeastern Nevada located 70 km south of Wendover Nevada contains seven sediment hosted disseminated gold deposits in Cambrian limestones and shales Mining ceased in 1999 with 138 000 ounces of gold mined at an average grade between 1 5 2 0 g t Resource estimates vary between 15 000 and 150 000 ounces of gold remaining in several mineralized pods Although exploration programs have been completed within the study area the structural history and timing of precious metal mineralization are still poorly understood This study aims to better understand the relation between stratigraphy structural setting and style of gold mineralization In order to accomplish these goals geological mapping at a scale of 1 5 000 was conducted over the property as well as analysis of soil and rock chip samples for multi element geochemistry Using cross cutting relationships the structural history of Kinsley Mountain has been determined The deformation can broadly be categorized as an early stage of compressional tectonics including folding attenuation of the stratigraphy and thrust faulting This early stage was followed by a series of extensional deformation events the youngest of which is an ongoing process The structural history determined from this study fits well into a regional context and when viewed in conjunction with the mineralization event can be used to bracket the timing of gold mineralization The northwest oriented structure responsible for concentrating decalcification silicification and mineralization has two generations of cave fill breccias that both pre and post date the gold event The statistical analysis of multi element geochemistry for rock chip and soil samples has determined that Au is most strongly associated with Te while weaker correlations exist between Au and Ag As Hg Mo Sb Tl and W This suite of elements is associated with an intrusion driven system and is atypical of Carlin type gold systems From these elemental associations the gold mineralization event is thought to be controlled by the emplacement of a felsic intrusion The responsible intrusion may be an exposed quartz monzonite to the south of the study area as suggested by possible zonation of Cu Pb and Zn which decrease in concentration with increasing distance from the outcropping stock Alternatively an unexposed intrusion at depth cannot be ruled out as the driver of the mineralizing system Stratigraphy, Structure, and Production History of the Trenton Limestone (Ordovician) and Adjacent Strata in Northwestern Ohio Lawrence H.
