

Sun- the ultimate source of energy

- Sun is a nearly perfect sphere of hot plasma having diameter of about 1.39 million kilometres (864,000 miles).
- Roughly three quarters of the Sun's mass consists of hydrogen (~73%); the rest is mostly helium (~25%), with much smaller quantities of heavier elements, including oxygen, carbon, neon, and iron
- It has formed approximately 4.6 billion years ago from the gravitational collapse of matter within a region of a large molecular cloud. Most of this matter gathered in the center, whereas the rest flattened into an orbiting disk that became the Solar System. The central mass (the Sun) became so hot and dense that it eventually initiated nuclear fusion in its core.
- The Sun currently fuses about 600 million tons of hydrogen into helium every second, converting 4 million tons of matter into energy. This is the source of sun's light and heat
