

## Systems

This is where Bullfrog steps from most other frameworks. The typical way to setup your systems when using Bullfrog is to have a folder in ReplicatedStorage that will contain all of your systems. Now theoretically, you don't have to do it this way. This way just makes the most sense to me. It allows you to group all of your code into specific folders. In each folder you have the server and the client code, all in one place! This allows for much easier management and organization. I believe this is what makes Bullfrog special! Bullfrog also takes advantage of the new Run Context feature! This is important as it allows local scripts to run inside ReplicatedStorage.

For Example: Here we have a camera system and a weapon system. You can see the camera system only has a client module. This is because systems don't need both client and server modules to work. Bullfrog will only start the environment it can find. Some systems may only have a server module, this also works. You may also notice that the modules in the weapon system have submodules. [I elaborate more on all this later.](#) You can see below an example of how code may typically structured when using Bullfrog, everything is neatly organized and containerized.

### Typical Setup

### Split Setup

Like I was saying earlier there are also other ways to structure this. Here is another example. In this setup the systems are divided among the server / client boundaries along with the startup scripts. This I suppose is more secure, but it gives up containerization and organization for security. This could be valuable to some people. I personally stick to the typical setup as I would rather forfeit some security to maintain sanity when working with a large codebase.
