A Guide to Data Compression Methods David Salomon,2013-03-20 In 1829 Louis Braille a young organist in a Paris

church blind since age 3 invented the well known code for the blind still in common use today all over the world and named after him Braille himself modified his code in 1834 and there have been several modifications since However the basic design of this code where each character is represented by a group of 3 x 2 dots has remained intact The dots are embossed on thick paper and each can be raised or flat i e present or absent Each dot is therefore equivalent to one bit of information As a result the Braille code Figure 1 is a 6 bit code and can therefore represent 64 symbols the code of six flat dots indicates a blank space Braille s followers extended the capabilities of his code in several ways One im portant extension is contractions These are letters that when they stand alone mean words For example the letter b standing alone or with punctuation means the word but the letter e standing alone means every and p means people Another extension is short form words These are combinations of two or more codes that mean an entire word short form words may contain contractions For example ab means about rcv means receive and the mvs means themselves The the in parentheses is a contraction dots 2 3 4 6 Figure 2 shows some examples of these special codes

Data Compression Techniques and Applications Thomas J. Lynch,1985

There is a growing interest in applying data compression techniques to actual data and communication systems in the commercial military and government agency sectors In each potential application there is a need to learn what compression techniques are available how they operate and what the implementation considerations are for each technique This book provides this information and serves as a reference for practicing communication engineers computer scientists information scientists and data systems managers No experience in data compression is necessary to use this book each compression technique is described separately and fully and the theoretical background developed so outside references are not needed

Image and Text Compression

James A. Storer,2012-12-06 James A Storer Computer Science Dept Brandeis University Waltham MA 02254

Data compression is the process of encoding a body of data to reduce stor age requirements With Lossless compression data can

be decompressed to be identical to the original whereas with lossy compression decompressed data may be an acceptable approximation according to some fidelity criterion to the original For example with digitized video it may only be necessary that the decompressed video look as good as the original to the human eye The two primary functions of data compression are Storage The capacity of a storage device can be effectively increased with data compression software or hardware that compresses a body of data on its way to the storage device and decompress it when it is retrieved Communications The bandwidth of a digital communication link can be effectively increased by compressing data at the sending end and decompressing data at the receiving end Here it can be crucial that compression and decompression can be performed in real time

Data Compression Gilbert Held,1991 *Data Compression - Exploring New Techniques* Debashis Chakraborty,Sandipan Bera,Sutirtha Ghosh,2012-05 Our project comprises of analysis of the existing algorithms for data compression so that we can utilize some features of these algorithms use them to build a more efficient algorithm We have also considered detailed study to observe the efficiency of the algorithms for different document types with the intention of building a comprehensive data compression technique We need to study and analyze all the algorithms separately to incorporate the positives from each of them and try to rectify the flaws that exist in these algorithms For clear elucidation of the data compression concepts we try to discuss each standard algorithm in detail There is a close connection between machine learning and compression a system that predicts the posterior probabilities of a sequence given its entire history can be used for optimal data compression by using arithmetic coding on the output distribution while an optimal compressor can be used for prediction by finding the symbol that compresses best given the previous history This equivalence has been used as justification for data compression as a benchmark for general intelligence
