Appel, 2002-10-21 This textbook describes all phases of a compiler lexical analysis parsing abstract syntax semantic actions intermediate representations instruction selection via tree matching dataflow analysis graph coloring register allocation and runtime systems It includes good coverage of current techniques in code generation and register allocation as well as the compilation of functional and object oriented languages that is missing from most books The most accepted and successful techniques are described concisely rather than as an exhaustive catalog of every possible variant and illustrated with actual Java classes This second edition has been extensively rewritten to include more discussion of Java and object oriented programming concepts such as visitor patterns A unique feature is the newly redesigned compiler project in Java for a subset of Java itself The project includes both front end and back end phases so that students can build a complete working compiler in one semester
