Statistical Methods For Environmental Pollution Monitoring:

Statistical Methods for Environmental Pollution Monitoring Richard O. Gilbert, 1987-02-15 This book discusses a broad range of statistical design and analysis methods that are particularly well suited to pollution data It explains key statistical techniques in easy to comprehend terms and uses practical examples exercises and case studies to illustrate procedures Dr Gilbert begins by discussing a space time framework for sampling pollutants He then shows how to use statistical sample survey methods to estimate average and total amounts of pollutants in the environment and how to determine the number of field samples and measurements to collect for this purpose Then a broad range of statistical analysis methods are described and illustrated These include determining the number of samples needed to find hot spots analyzing pollution data that are lognormally distributed testing for trends over time or space estimating the magnitude of trends comparing pollution data from two or more populations New areas discussed in this sourcebook include statistical techniques for data that are correlated reported as less than the measurement detection limit or obtained from field composited samples Nonparametric statistical analysis methods are emphasized since parametric procedures are often not appropriate for pollution data This book also provides an illustrated comprehensive computer code for nonparametric trend detection and estimation analyses as well as nineteen statistical tables to permit easy application of the discussed statistical techniques In addition many publications are cited that deal with the design of pollution studies and the statistical analysis of pollution data This sourcebook will be a useful tool for applied statisticians ecologists radioecologists hydrologists biologists environmental engineers and other professionals who deal with the collection analysis and interpretation of pollution in air water and soil

Statistical Methods for Environmental Pollution Monitoring ,1987 The application of statistics to environmental pollution monitoring studies requires a knowledge of statistical analysis methods particularly well suited to pollution data This book fills that need by providing sampling plans statistical tests parameter estimation procedure techniques and references to pertinent publications Most of the statistical techniques are relatively simple and examples exercises and case studies are provided to illustrate procedures The book is logically divided into three parts Chapters 1 2 and 3 are introductory chapters Chapters 4 through 10 discuss field sampling designs and Chapters 11 through 18 deal with a broad range of statistical analysis procedures Some statistical techniques given here are not commonly seen in statistics book For example see methods for handling correlated data Sections 4 5 and 11 12 for detecting hot spots Chapter 10 and for estimating a confidence interval for the mean of a lognormal distribution Section 13 2 Also Appendix B lists a computer code that estimates and tests for trends over time at one or more monitoring stations using nonparametric methods Chapters 16 and 17 Unfortunately some important topics could not be included because of their complexity and the need to limit the length of the book For example only brief mention could be made of time series analysis using Box Jenkins methods and of kriging techniques for estimating spatial and spatial time patterns of pollution although multiple references on these topics

are provided Also no discussion of methods for assessing risks from environmental pollution could be included

Statistical Methods for Detection and Quantification of Environmental Contamination Robert D. Gibbons, David E. Coleman, 2001-07-13 Amstat News asked three review editors to rate their top five favorite books in the September 2003 issue Statistical Methods for Detection and Quantification of Environmental Contamination was among those chosen This groundbreaking volume describes the statistical theory that underlies the detection and quantification of environmental pollution both in the laboratory and in the field It presents the foundation of relating measured concentrations to true concentrations and the development of intervals of uncertainty for true concentrations and it presents a comprehensive review of the problem of estimating thresholds at which detection and quantification decisions can be made reliably The authors demonstrate the use of analytical measurements in making environmental impact decisions and in comparing environmental data to regulatory standards and naturally occurring background concentrations Taking the next step in a major evolution in the way environmental impact decisions are made Statistical Methods for Detection and Quantification of Environmental Contamination Presents statistical methods that allow the earliest possible detection and quantification of contaminants Describes procedures applicable to all environmental constituents Covers numerous state of the art approaches Includes case studies demonstrating practical applications of these approaches An indispensable handbook for scientists and engineers involved in environmental monitoring programs this book is also an important resource for public health officials waste facility managers regulators statisticians and analytical chemists

Statistical Procedures for Analysis of Environmental Monitoring Data and Risk Assessment Edward A. McBean, Frank A. Rovers, 1998 For students and professionals in environmental civil and mechanical engineering few tasks are as challenging as statistical analysis and interpretation In this book two leaders in the field address these challenges head on They introduce each leading statistical analysis technique downplaying mathematical notation in favor of sample environmental applications and explanations that make sense to non statisticians They also address common problems in data interpretation small data

sets the need to correlate constituents to infill missing data or identify outliers creating early warning systems with fewer false positives handling noise and assessing risk Coverage includes Characterizing environmental quality data with Normal Lognormal and other distributions Characterizing coincident behavior using regression correlation and multiple regression Multiple comparisons using ANOVA and associated parametric analysis techniques Testing differences between monitoring records when censored data records exist Focuses on real world situations where data sets may be imperfect Reflecting decades of experience in the field the authors also show how to use statistical analysis as the input to realistic risk assessment In particular they demonstrate simulation procedures for risk characterization using sampling methodologies from probability distributions of data Whether you are concerned with issues of air quality surface water groundwater or soil contamination the techniques covered in this book will be invaluable
