Spotlight-Mode Synthetic Aperture Radar: A Signal Processing Approach Charles V. J. Jakowatz, Daniel E. Wahl, Paul H. Eichel, Dennis C. Ghiglia, Paul A. Thompson, 2012-12-06 Modern airborne and spaceborne imaging radars known as synthetic aperture radars SARs are capable of producing high quality pictures of the earth's surface while avoiding some of the shortcomings of certain other forms of remote imaging systems Primarily radar overcomes the nighttime limitations of optical cameras and the cloud cover limitations of both optical and infrared imagers In addition because imaging radars use a form of coherent illumination they can be used in certain special modes such as interferometry to produce some unique derivative image products that incoherent systems cannot One such product is a highly accurate digital terrain elevation map DTEM The most recent ca 1980 version of imaging radar known as spotlight mode SAR can produce imagery with spatial resolution that begins to approach that of remote optical imagers For all of these reasons synthetic aperture radar imaging is rapidly becoming a key technology in the world of modern remote sensing Much of the basic workings of synthetic aperture radars is rooted in the concepts of signal processing Starting with that premise this book explores in depth the fundamental principles upon which the spotlight mode of SAR imaging is constructed using almost exclusively the language concepts and major building blocks of signal processing Spotlight Mode Synthetic Aperture Radar A Signal Processing Approach is intended for a variety of audiences Engineers and scientists working in the field of remote sensing but who do not have experience with SAR imaging will find an easy entrance into what can seem at times a very complicated subject Experienced radar engineers will find that the book describes several modern areas of SAR processing that they might not have explored previously e g interferometric SAR for change detection and terrain elevation mapping or modern non parametric

approaches to SAR autofocus Senior undergraduates primarily in electrical engineering who have had courses in digital signal and image processing but who have had no exposure to SAR could find the book useful in a one semester course as a reference

Synthetic Aperture Radar J. Patrick Fitch, 2012-12-06 Radar like most well developed areas has its own vocabulary Words like Doppler frequency pulse compression mismatched filter carrier frequency in phase and quadrature have specific meaning to the radar engineer In fact the word radar is actually an acronym for RADio Detection And Rang ing Even though these words are well defined they can act as road blocks which keep people without a radar background from utilizing the large amount of data literature and expertise within the radar community This is unfortunate because the use of digital radar processing techniques has made possible the analysis of radar signals on many general purpose digital computers Of special interest are the surface mapping radars such as the Seasat and the shuttle imaging radars which utilize a technique known as synthetic aperture radar SAR to create high resolution images pictures This data appeals to cartographers agronomists oceanographers and others who want to perform image enhancement parameter estimation pattern recognition and other information extraction techniques on the radar imagery The first chapter presents the basics of radar processing techniques for calculating range distance by measuring round trip propagation times for radar pulses This is the same technique that sightseers use when calculating the width of a canyon by timing the round trip delay using echoes In fact the corresponding approach in radar is usually called the pulse echo technique

Digital Processing of Synthetic Aperture Radar Data Ian G. Cumming, 2005

Model-based Stripmap Synthetic Aperture Radar Processing Roger D. West, 2011 Synthetic aperture radar SAR is a type of remote sensor that provides its own illumination and is capable of forming high resolution images of the reflectivity of a scene The reflectivity of the scene that is measured is dependent on the choice of carrier frequency different carrier frequencies will yield different images of the same scene There are different modes for SAR sensors two common modes are spotlight mode and stripmap mode Furthermore SAR sensors can either be continuously transmitting a signal or they can transmit a pulse at some pulse repetition frequency PRF The work in this dissertation is for pulsed stripmap SAR sensors The resolvable limit of closely spaced reflectors in range is determined by the bandwidth of the transmitted signal and the resolvable limit in azimuth is determined by the bandwidth of the induced azimuth signal which is strongly dependent on the length of the physical antenna on the SAR sensor The point spread function PSF of a SAR system is determined by these resolvable limits and is limited by the physical attributes of the SAR sensor The PSF of a SAR system can be defined in different ways For example it can be defined in terms of the SAR system including the image processing algorithm By using this definition the PSF is an algorithm specific sinc like function and produces the bright star like artifacts that are noticeable around strong reflectors in the focused image The PSF can also be defined in terms of just the SAR system before any image processing algorithm is applied This second definition of the PSF will be used in this dissertation Using this definition the bright algorithm specific star like artifacts will be denoted as the inter pixel interference IPI of the algorithm To be specific the combined effect of the second definition of PSF and the algorithm dependent IPI is a decomposition of the first definition of PSF A new comprehensive forward model for stripmap SAR is derived in this dissertation New image formation methods are derived in this dissertation that invert this forward model and it is shown that the IPI that corrupts traditionally processed stripmap SAR images can be removed The removal of the IPI can increase the resolvability to the resolution limit thus making image analysis much easier SAR data is inherently corrupted by uncompensated phase errors These phase errors lower the contrast of the image and corrupt the azimuth processing which inhibits proper focusing to the point of the reconstructed image being unusable If these phase errors are not compensated for the images formed by system inversion are useless as well A model based autofocus method is also derived in this dissertation that complements the forward model and corrects these phase errors before system inversion
