Systemc Methodologies And Applications:

SystemC Wolfgang Müller,Wolfgang Rosenstiel,Jürgen Ruf,2007-05-08 SystemC has received a wide acceptance by users and tool vendors as the next generation system description language in order to deal with higher levels of abstraction for complex SoC designs SystemC Methodologies and Applications gives a comprehensive survey on the state of the art of SystemC in industry and research Organised into 11 self contained chapters selected SystemC experts present their approaches in the domains of modelling analysis synthesis Their contributions range from mixed signal and discrete system to embedded software The chapters give a broad overview of recent advances in SystemC methodologies and applications and are mainly based on presentations given at the European SystemC User Group meetings

Design Methods and Applications for Distributed Embedded Systems Bernd Kleinjohann,Guang R. Gao,Hermann Kopetz,Lisa Kleinjohann,Achim Rettberg,2006-04-11 The IFIP TC 10 Working Conference on Distributed and Parallel Embedded Systems DIPES 2004 brings together experts from industry and academia to discuss recent developments in this important and growing field in the splendid city of Toulouse France The ever decreasing price performance ratio of microcontrollers makes it economically attractive to replace more and more conventional mechanical or electronic control systems within many products by embedded real time computer systems An embedded real time computer system is always part of a well specified larger system which we call an intelligent product Although most intelligent products start out as stand alone units many of them are required to interact with other systems at a later stage At present many industries are in the middle of this transition from stand alone products to networked embedded systems This transition requires reflection and architecting The complexity of the evolving distributed artifact can only be controlled if careful planning and principled design methods replace the hoc engineering of the first version of many standalone embedded products

ESL Models and their Application Brian Bailey,Grant Martin,2009-12-15 This book arises from experience the authors have gained from years of work as industry practitioners in the field of Electronic System Level design ESL At the heart of all things related to Electronic Design Automation EDA the core issue is one of models what are the models used for what should the models contain and how should they be written and distributed Issues such as interoperability and tool transportability become central factors that may decide which ones are successful and those that cannot get sufficient traction in the industry to survive Through a set of real examples taken from recent industry experience this book will distill the state of the art in terms of System Level Design models and provide practical guidance to readers that can be put into use This book is an invaluable tool that will aid readers in their own designs reduce risk in development projects expand the scope of design projects and improve developmental processes and project planning

Formal Methods: Applications and Technology Lubos Brim,Boudewijn Haverkort,Martin Leucker,Jaco van de Pol,2007-06-27 This book constitutes the thoroughly refereed joint post proceedings of the two International Workshops on Formal Methods for Industrial Critical Systems FMICS 2006

and on Parallel and Distributed Methods in Verification PDMC 2006 held in Bonn Germany in August 2006 in the course of the 17th International Conference on Concurrency Theory CONCUR 2006 Behavioral Modeling for Embedded Systems and Technologies: Applications for Design and Implementation Gomes, Luis, Fernandes, Jo?o M., 2009-07-31 This book provides innovative behavior models currently used for developing embedded systems accentuating on graphical and visual notations Provided by publisher *Energy Harvesting Systems* Tom J. Kazmierski, Steve Beeby, 2010-11-01 Kinetic energy harvesting converts movement or vibrations into electrical energy enables battery free operation of wireless sensors and autonomous devices and facilitates their placement in locations where replacing a battery is not feasible or attractive This book provides an introduction to operating principles and design methods of modern kinetic energy harvesting systems and explains the implications of harvested power on autonomous electronic systems design It describes power conditioning circuits that maximize available energy and electronic systems design strategies that minimize power consumption and enable operation The principles discussed in the book will be supported by real case studies such as battery less monitoring sensors at water waste processing plants embedded battery less sensors in automotive electronics and sensor networks built with ultra low power wireless nodes suitable for battery less applications **SystemC: From the Ground Up** David C. Black, Jack Donovan, 2004-05-31 SystemC provides a robust set of extensions to C that enables rapid development of complex hardware software systems This book focuses on the practical uses of the language for modeling real systems The wealth of examples and downloadable code methodically guide the reader through the finer points of the SystemC language This work provides A step by step build up of syntax NEW features of SystemC 2 1 Code examples for each concept Many resource references Coding styles and guidelines Over 52 downloadable code examples over 8 000 lines Exercises throughout the book How SystemC fits into the system design methodology Why features are as they are Well known consultants in the EDA industry both David Black and Jack Donovan have been involved in the adoption and teaching of new technologies and methodologies for a combined total of 42 years Recently they jointly founded a consultancy Eklectic Ally focused on helping companies adopt SystemC methodologies **Proceedings of the ... ACM Great Lakes Symposium on VLSI. ,2006**

Dynamic Modelling Alisson Brito, 2010-01-01 When talking about modelling it is natural to talk about simulation Simulation is the imitation of the operation of a real world process or systems over time The objective is to generate a history of the model and the observation of that history helps us understand how the real world system works not necessarily involving the real world into this process A system or process model takes the form of a set of assumptions concerning its operation In a model mathematical and logical assumptions are considered and entities and their relationship are delimited The objective of a model and its respective simulation is to answer a vast number of what if questions Some questions answered in this book are What if the power distribution system does not work as expected What if the produced ships were not able to transport all the demanded containers through the Yangtze River in China And what if an installed wind farm does

not produce the expected amount of energy Answering these questions without a dynamic simulation model could be extremely expensive or even impossible in some cases and this book aims to present possible solutions to these problems
