Vanishing Vector:

Geometry of Black Holes Piotr T. Chruściel, 2020 Black holes present one of the most fascinating predictions of Einstein's general relativity with strong evidence of their existence through observations of many means The book provides a wide background to the current research on all mathematical aspects of the geometry of black hole spacetimes

Complex Analytic Geometry: From The Localization Viewpoint Tatsuo Suwa, 2024-02-21 Complex Analytic Geometry is a subject that could be termed in short as the study of the sets of common zeros of complex analytic functions It has a long history and is closely related to many other fields of Mathematics and Sciences where numerous applications have been found including a recent one in the Sato hyperfunction theory This book is concerned with among others local invariants that arise naturally in Complex Analytic Geometry and their relations with global invariants of the manifold or variety The idea is to look at them as residues associated with the localization of some characteristic classes Two approaches are taken for this topological and differential geometric and the combination of the two brings out further fruitful results For this on one hand we present detailed description of the Alexander duality in combinatorial topology On the other hand we give a thorough presentation of the de Rham cohomology and integration theory on it This viewpoint provides us with the way for clearer and more precise presentations of the central concepts as well as fundamental and important results that have been treated only globally so far It also brings new perspectives into the subject and leads to further results and applications The book starts off with basic material and continues by introducing characteristic classes via both the obstruction theory and the Chern Weil theory explaining the idea of localization of characteristic classes and presenting the aforementioned invariants and relations in a unified way from this perspective Various related topics are also discussed The expositions are carried out in a self containing manner and includes recent developments The profound consequences of this subject will make the book useful for students and researchers in fields as diverse as Algebraic Geometry Complex Analytic Geometry Differential Geometry Topology Singularity Theory Complex Dynamical Systems Algebraic Analysis and Mathematical Physics

Newton-Cartan Gravity Philip K. Schwartz, 2026-01-27 This book offers an introduction to Newton Cartan gravity a reformulation of Newtonian gravity in differential geometric language which brings it closer to General Relativity GR than the standard formulation The text systematically develops Newton Cartan gravity from its geometric foundations and provides a detailed discussion of the classical results on its relation to both standard Newtonian gravity and GR Furthermore it presents a global formulation of the gauge theoretic perspective that underlies many modern developments in

this field and briefly discusses applications in Newtonian limits of string theory This book is designed for researchers and graduate students in gravitational physics and related disciplines providing a clear path toward understanding current research literature The book is written in a rigorous mathematical style It includes an extensive set of illustrative exercises A solid understanding of basic differential geometry is required familiarity with principal bundles and associated vector bundles is necessary for the gauge theoretic part

Topics in Modern Differential Geometry Stefan Haesen, Leopold Verstraelen, 2016-12-21 A variety of introductory articles is provided on a wide range of topics including variational problems on curves and surfaces with anisotropic curvature Experts in the fields of Riemannian Lorentzian and contact geometry present state of the art reviews of their topics The contributions are written on a graduate level and contain extended bibliographies The ten chapters are the result of various doctoral courses which were held in 2009 and 2010 at universities in Leuven Serbia Romania and Spain

Quantization, PDEs, and Geometry Dorothea Bahns, Wolfram Bauer, Ingo Witt, 2016-02-11 This book presents four survey articles on different topics in mathematical analysis that are closely linked to concepts and applications in physics Specifically it discusses global aspects of elliptic PDEs Berezin Toeplitz quantization the stability of solitary waves and sub Riemannian geometry The contributions are based on lectures given by distinguished experts at a summer school in Göttingen The authors explain fundamental concepts and ideas and present them clearly Starting from basic notions these course notes take the reader to the point of current research highlighting new challenges and addressing unsolved problems at the interface between mathematics and physics All contributions are of interest to researchers in the respective fields but they are also accessible to graduate students

Floer Homology, Gauge Theory, and Low-Dimensional Topology Clay Mathematics Institute. Summer School, 2006 Mathematical gauge theory studies connections on principal bundles or more precisely the solution spaces of certain partial differential equations for such connections Historically these equations have come from mathematical physics and play an important role in the description of the electro weak and strong nuclear forces The use of gauge theory as a tool for studying topological properties of four manifolds was pioneered by the fundamental work of Simon Donaldson in the early 1980s and was revolutionized by the introduction of the Seiberg Witten equations in the mid 1990s Since the birth of the subject it has retained its close connection with symplectic topology The analogy between these two fields of study was further underscored by Andreas Floer's construction of an infinite dimensional variant of Morse theory that applies in two a priori different contexts either to define symplectic invariants for pairs of Lagrangian submanifolds of a symplectic manifold or to define topological invariants for three manifolds which fit into a framework for calculating invariants for smooth four manifolds Heegaard Floer homology the recently discovered invariant for three and four manifolds comes from an application of Lagrangian Floer homology to spaces associated to Heegaard diagrams Although this theory is

conjecturally isomorphic to Seiberg Witten theory it is more topological and combinatorial in flavor and thus easier to work with in certain contexts The interaction between gauge theory low dimensional topology and symplectic geometry has led to a number of striking new developments in these fields The aim of this volume is to introduce graduate students and researchers in other fields to some of these exciting developments with a special emphasis on the very fruitful interplay between disciplines This volume is based on lecture courses and advanced seminars given at the 2004 Clay Mathematics Institute Summer School at the Alfred Renyi Institute of Mathematics in Budapest Hungary Several of the authors have added a considerable amount of additional material to that presented at the school and the resulting volume provides a state of the art introduction to current research covering material from Heegaard Floer homology contact geometry smooth four manifold topology and symplectic four manifolds
