Genomics, Functional, Evolutionary, and Ecological Perspectives on the Biology of Carnivorous Plants Magdy S. Alabady, Jim Leebens-Mack, Kenji Fukushima, Jeremy D. Rentsch, Russell L. Malmberg, 2024-12-13 Darwin was fascinated by the multitude of physiological and morphological adaptations of carnivorous plants and consequently referred to them as the most wonderful plants in the world. The carnivorous behavior evolved independently at least six times in five angiosperm orders in plants that live in barren nutrient deficient environments. Carnivorous plants capture insects to get access to the nitrogen and phosphorus contained in their bodies. Their leaves are specialized to perform multiple functions: secrete attractive scents, capture insects, secrete extracellular digestive enzymes, absorb nutrients, photosynthesize and develop symbioses. Despite their independent origins there is a remarkable morphological convergence of the traps and physiological convergence of the mechanisms for digesting and assimilating prey. These charismatic plants have evolved at least five major types of insect capturing mechanisms and can

also be autotropic under certain sentimental conditions These complex plants can be unique models for studying rapid organ movements excitability enzyme secretion nutrient absorption food web relationships phylogenetic and intergeneric relationships symbiosis cross species regulatory networks and convergent evolution The genomics revolution is giving us novel insights into the evolutionary history of these plants and the nature of their unique adaptations For instance the U gibba genome reveals the role of small scale tandem duplications in the carnivorous adaptation a potential explanation of the evolution of carnivorous traits such as attraction trapping digestions and absorption came from the genome of *C. follicularis* and a mapping population including F1 F2 and BC and their genetic linkage map have been developed for the *Sarracenia* species To increase our functional understanding of carnivorous plants further these findings need to be related to the unique properties of their habitats and interactions among plants with insects and microbes The multiple origins and evolutionary convergence of their specific nutrient economics renders carnivorous plants most interesting study systems in functional ecology Altogether these advances are ushering a new era of understanding of plant carnivory at genomics molecular and ecological functions and evolutionary levels
