

Southern Cross and Equatorial Pattern of stars and dark nebulae, suggesting "Star" in the sky. The Southern Cross is a constellation of stars, visible to unaided eye. They are located in wide-field telescope.

STAR CHARTS AND SETTING CIRCLES

Star charts are the astronomer's maps of the sky. With them he locates stars and other objects whose positions on the celestial sphere change little from year to year. On them he plots courses of Sun, planets, and other objects whose positions change more noticeably. Like maps of Earth's surface, star charts are prepared according to different scales. They show varying amounts of detail.

The charts on pages 114-123 are limited mostly to stars and other objects that can be seen with unaided eye and binoculars. The limit of these charts is, for the most part, about 5th magnitude. Special charts showing

all the stars that can be seen with small telescopes have to be much more detailed; some include objects to a magnitude of 13 or 14. A full set of charts detailed enough to show all stars visible in binoculars alone can fill a small atlas.

Star Names and Designations

The bright stars on most charts are designated by Greek letters:

- | | | |
|-----------|-----------|-----------|
| • Alpha | • Iota | • Rho |
| • Beta | • Kappa | • Sigma |
| • Gamma | • Lambda | • Tau |
| • Delta | • Mu | • Upsilon |
| • Epsilon | • Nu | • Phi |
| • Zeta | • Xi | • Chi |
| • Eta | • Omicron | • Psi |
| • Theta | • Pi | • Omega |

Except for a few examples such as *Castor* and *Pollux*, in *Gemini*, the brightest star in a constellation is given the letter α , the next brightest β , and so on.

Ancient sky observers gave names to the stars. Our modern charts retain the Greek letter designations and name only the brightest stars, such as *Sirius*, *Procyon*, *Arcturus*, and *Antares*. To identify a star, we may simply use its name, such as *Sirius*, which everyone knows is *Sirius*, in the constellation *Orion*. However, if we designate the star as α , we write as *Orion α* , using the Latin genitive of the constellation name.

Sky Coordinates

Most star charts (such as those in this book) have a gridwork of ver-

tical and horizontal lines, indicating right ascension and declination. These correspond to the geographer's lines of longitude and latitude.

The lines of right ascension are drawn between the celestial poles, and the lines of declination are drawn around the celestial sphere parallel to the celestial equator. Just as the location of any city on Earth can be pinpointed by stating its longitude and latitude, so the location of any object on the celestial sphere can be pinpointed by its right ascension and declination.

Declination, or distance from the celestial equator, is measured in degrees and minutes of arc. Declination north of the celestial equator is indicated by a plus (+) sign; south, by a minus (-) sign.

Right ascension and declination (celestial sphere) is depicted by means of lines indicating right ascension and declination. Lines of right ascension correspond to longitude, or lines of longitude, or lines of declination correspond to lines of latitude. The diagram represents only half of celestial sphere; the other half portion, when both sides are shown, is right ascension from 0° to 240°.
