Seeing Things as They are John R. Searle, 2015 This book provides a comprehensive account of the intentionality of perceptual experience With special emphasis on vision Searle explains how the raw phenomenology of perception sets the content and the conditions of satisfaction of experience The central question concerns the relation between the subjective conscious perceptual field and the objective perceptual field Everything in the objective field is either perceived or can be perceived Nothing in the subjective field is perceived nor can be perceived precisely because the events in the subjective field consist of the perceivings whether veridical or not of the events in the objective field Searle begins by criticizing the classical theories of perception and identifies a single fallacy what he calls the Bad Argument as the source of nearly all of the confusions in the history of the philosophy of perception He next justifies the claim that perceptual experiences have presentational intentionality and shows how this justifies the direct realism of his account In the central theoretical chapters he shows how it is possible that the raw phenomenology must necessarily determine certain form of intentionality Searle introduces in detail the distinction between different levels of perception from the basic level to the higher levels and shows the internal

relation between the features of the experience and the states of affairs presented by the experience. The account applies not just to language possessing human beings but to infants and conscious animals. He also discusses how the account relates to certain traditional puzzles about spectrum inversion, color and size constancy, and the brain in the vat thought experiments. In the final chapters, he explains and refutes Disjunctivist theories of perception, explains the role of unconscious perception, and concludes by discussing traditional problems of perception such as skepticism.

An Essay Towards a New Theory of Vision  
George Berkeley, 2022-06-02

In *An Essay Towards a New Theory of Vision*, George Berkeley presents a groundbreaking exploration of visual perception that challenges the prevailing Cartesian views of his time. Through meticulous argumentation and innovative thought, Berkeley posits that visual experience is not merely a passive reception of light but is actively shaped by the mind's inherent structures. He intricately examines the relationship between sight and distance, using reflections on empirical observation and philosophical inquiry to argue that what is seen is inextricably linked to the observer's prior sensory experiences. This work not only anticipates later developments in the philosophy of perception but also engages with the empirical methodologies emerging in the early 18th century, thus cementing Berkeley's legacy in both philosophy and optics.

George Berkeley, an Irish philosopher and a leading figure of the empiricist movement, was profoundly influenced by the works of John Locke and the emergent scientific discourse of his era. His unique focus on the subjective nature of reality and his rejection of materialism stem from his theological commitments and fervent belief in the primacy of perception. Berkeley's wider philosophical pursuits, intersecting metaphysics and epistemology, provide a rich backdrop for his insights on vision, reflecting his desire to reconcile sensory experience with philosophical rigor. This compelling treatise is a must-read for scholars and enthusiasts of philosophy, optics, and cognitive science. Berkeley's innovative approach invites readers to reconsider their understanding of vision's role in shaping experience and knowledge. By delving into Berkeley's arguments, readers will gain not only philosophical insights but also a profound appreciation for the complexities of human perception, making this work a seminal contribution to the fields of both philosophy and the natural sciences.
