## **Zigzag Path:**

**Distributed Algorithms for Message-Passing Systems** Michel Raynal, 2013-06-29 Distributed computing is at the heart of many applications. It arises as soon as one has to solve a problem in terms of entities such as processes, peers, processors, nodes, or agents that individually have only a partial knowledge of the many input parameters associated with the problem. In particular, each entity cooperating towards the common goal cannot have an instantaneous knowledge of the current state of the other entities. Whereas parallel computing is mainly concerned with efficiency and real-time computing is mainly concerned with on-time computing, distributed computing is mainly concerned with mastering uncertainty created by issues such as the multiplicity of control flows, asynchronous communication, unstable behaviors, mobility, and dynamicity. While some distributed algorithms consist of a few lines only, their behavior can be difficult to understand and their properties hard to state and prove. The aim of this book is to present in a comprehensive way the basic notions, concepts, and algorithms of distributed computing when the distributed entities cooperate by sending and receiving messages on top of an asynchronous network. The book is composed of seventeen chapters structured into six parts: distributed graph algorithms in particular, what makes them different from sequential or parallel algorithms; logical time and global states; the core of the book: mutual exclusion and resource allocation; high-level communication abstractions; distributed detection of properties and distributed shared memory. The author establishes clear objectives per chapter, and the content is supported throughout with illustrative examples, summaries, exercises, and annotated bibliographies. This book constitutes an introduction to distributed computing and is suitable for advanced undergraduate students or graduate students in computer science and computer engineering; graduate students in mathematics interested in distributed computing; and practitioners and engineers involved in the design and implementation of distributed applications. The reader should have a basic knowledge of algorithms and operating systems.

**Distributed System Design** Jie Wu, 2017-12-14 Future requirements for computing speed, system reliability, and cost effectiveness entail the development of alternative computers to replace the traditional von Neumann organization. As computing networks come into being, one of the latest dreams is now possible: distributed computing. Distributed computing brings transparent access to as much computer power and data as the user needs for accomplishing any given task simultaneously, achieving high performance and reliability. The subject of distributed computing is diverse, and many researchers are investigating various issues concerning the structure of hardware and the design of distributed software. Distributed System Design defines a distributed system as one that looks to its users like an ordinary system but runs on a set of autonomous processing elements (PEs) where each PE has a separate physical memory space and the message transmission delay is not negligible. With close cooperation among these PEs, the system supports an arbitrary number of processes and dynamic extensions. Distributed System Design outlines the main motivations for building a distributed system, including inherently distributed applications, performance, cost, resource sharing, flexibility, and extendibility, availability, and

fault tolerance scalability Presenting basic concepts problems and possible solutions this reference serves graduate students in distributed system design as well as computer professionals analyzing and designing distributed open parallel systems Chapters discuss the scope of distributed computing systems general distributed programming languages and a CSP like distributed control description language DCDL expressing parallelism interprocess communication and synchronization and fault tolerant design two approaches describing a distributed system the time space view and the interleaving view mutual exclusion and related issues including election bidding and self stabilization prevention and detection of deadlock reliability safety and security as well as various methods of handling node communication Byzantine and software faults efficient interprocessor communication mechanisms as well as these mechanisms without specific constraints such as adaptiveness deadlock freedom and fault tolerance virtual channels and virtual networks load distribution problems synchronization of access to shared data while supporting a high degree of concurrency

**Algorithms and Data Structures** Frank Dehne, Jörg-Rüdiger Sack, Norbert Zeh, 2007-08-21 This book constitutes the refereed proceedings of the 10th International Workshop on Algorithms and Data Structures WADS 2007 held in Halifax Canada in August 2007 The papers present original research on the theory and application of algorithms and data structures in all areas including combinatorics computational geometry databases graphics parallel and distributed computing

**Distributed Computing** Ajay D. Kshemkalyani, Mukesh Singhal, 2011-03-03 Designing distributed computing systems is a complex process requiring a solid understanding of the design problems and the theoretical and practical aspects of their solutions This comprehensive textbook covers the fundamental principles and models underlying the theory algorithms and systems aspects of distributed computing Broad and detailed coverage of the theory is balanced with practical systems related issues such as mutual exclusion deadlock detection authentication and failure recovery Algorithms are carefully selected lucidly presented and described without complex proofs Simple explanations and illustrations are used to elucidate the algorithms Important emerging topics such as peer to peer networks and network security are also considered With vital algorithms numerous illustrations examples and homework problems this textbook is suitable for advanced undergraduate and graduate students of electrical and computer engineering and computer science Practitioners in data networking and sensor networks will also find this a valuable resource Additional resources are available online at [www.cambridge.org/9780521876346](http://www.cambridge.org/9780521876346)
