

DESIGN OF STRUCTURAL STEELWORK ELEMENTS (BS 5950)

By: Dr Mohamed Careem

INTRODUCTION FOR BEAM DESIGN

- The top flange of a simply supported beam subject to gravity loads will be in compression and like any element in compression will try to buckle.
- The bottom flange is in tension and will try to remain straight. Therefore, if there is insufficient restraint to the top flange, it will buckle laterally, i.e. out of the plane of the applied load.
- The lateral buckling of the compression flange of a beam involves lateral torsional buckling.
- A restrained beam is one in which the compression flange is supported from buckling.
