Strong Shape And Homology:

Strong Shape and Homology Sibe Mardesic, 2013-03-14 Shape theory is an extension of homotopy theory from the realm of CW complexes to arbitrary spaces Besides applications in topology it has interesting applications in various other areas of mathematics especially in dynamical systems and C algebras Strong shape is a refinement of ordinary shape with distinct advantages over the latter Strong homology generalizes Steenrod homology and is an invariant of strong shape The book gives a detailed account based on approximation of spaces by polyhedra ANR s using the technique of inverse systems It is intended for researchers and graduate students Special care is devoted to motivation and bibliographic notes

Handbook of the History of General Topology C.E. Aull, R. Lowen, 2013-04-18 This book is the first one of a work in several volumes treating the history of the development of topology The work contains papers which can be classified into 4 main areas Thus there are contributions dealing with the life and work of individual topologists with specific schools of topology with research in topology in various countries and with the development of topology in different periods The work is not restricted to topology in the strictest sense but also deals with applications and generalisations in a broad sense Thus it also treats e g categorical topology interactions with functional analysis convergence spaces and uniform spaces Written by specialists in the field it contains a wealth of information which is not available anywhere else History of Topology I.M. James, 1999-08-24 Topology for many years has been one of the most exciting and influential fields of research in modern mathematics Although its origins may be traced back several hundred years it was Poincaré who gave topology wings in a classic series of articles published around the turn of the century While the earlier history sometimes called the prehistory is also considered this volume is mainly concerned with the more recent history of topology from Poincaré onwards As will be seen from the list of contents the articles cover a wide range of topics Some are more technical than others but the reader without a great deal of technical knowledge should still find most of the articles accessible Some are written by professional historians of mathematics others by historically minded mathematicians who tend to have a different viewpoint *Glasnik Matematički*, 1986 **Geometric and Algebraic Topology** Henryk Toruńczyk, Stefan Jackowski, Stanisław Spieź, 1986

active areas The main topics and themes represented by the papers of this volume include decomposition theory cell like mappings and CE equivalent compacta covering dimension versus cohomological dimension ANR s and LCn compacta homology manifolds embeddings of continua into manifolds complement theorems in shape theory approximate fibrations and shape fibrations fibered shape exact homologies and strong shape theory *Geometric Topology and Set Theory* A.
