*Financial Instrument Pricing Using C++* Daniel J. Duffy, 2018-09-05

An integrated guide to C and computational finance. This complete guide to C and computational finance is a follow up and major extension to Daniel J Duffy's 2004 edition of *Financial Instrument Pricing Using C*. Both C and computational finance have evolved and changed dramatically in the last ten years and this book documents these improvements. Duffy focuses on these developments and the advantages for the quant developer by delving into a detailed account of the new C 11 standard and its applicability to computational finance. Using de facto standard libraries such as Boost and Eigen to improve developer productivity. Developing multiparadigm software using the object oriented, generic and functional programming styles. Designing flexible numerical algorithms, modern numerical methods and multiparadigm design patterns. Providing a detailed explanation of the Finite Difference Methods through six chapters including new developments such as ADE, Method of Lines, MOL and Uncertain Volatility Models. Developing applications from financial model to algorithmic design and code through a coherent approach. Generating interoperability with Excel add ins, C and C CLI. Using random number generation in C 11 and Monte Carlo simulation. Duffy adopted a spiral model approach while writing each chapter of *Financial Instrument Pricing Using C 2e*: analyse a little, design a little and code a little. Each cycle ends with a working prototype in C and shows how a given algorithm or numerical method works. Additionally, each chapter contains non-trivial exercises and projects that discuss improvements and extensions to the material. This book is for designers and application developers in computational finance and assumes the reader has some fundamental experience of C and derivatives pricing.
