

UNDERSTANDING LEUKEMIA

What Is Leukemia?

Leukemia is a group of cancers that starts in the bone marrow and produces abnormal blood cells in the body. The abnormal cells typically lack normal features that help them to function properly. In some cases, leukemia can spread to other organs in the body, such as the spleen, liver, and lymph nodes.

Blood Cell Development

Blood cells are produced through a process called hematopoiesis. The process of blood cell formation starts in the bone marrow, where stem cells differentiate into various types of blood cells. These cells then travel through the bloodstream to various parts of the body to perform their functions.

What Is the Function of Blood?

Blood is a complex fluid that carries oxygen and nutrients to the body's cells and removes waste products. It also plays a role in the immune system and the regulation of body temperature.

What Are the Causes and the Risk Factors?

The exact cause of leukemia is still unknown, but several factors are believed to contribute to its development:

- Genetic mutations
- Environmental factors
- Radiation exposure
- Chemical exposure
- Bone marrow failure
- Previous cancer treatment

What Are the Treatment Options?

Treatment options for leukemia depend on the type and stage of the disease. Common treatments include:

- Chemotherapy
- Radiation therapy
- Targeted therapy
- Stem cell transplantation
- Supportive care

- **Acute Myeloid Leukemia (AML):** Treatment options include chemotherapy, radiation therapy, and stem cell transplantation. The goal is to kill the cancer cells and restore the bone marrow's ability to produce healthy blood cells.
- **Chronic Myeloid Leukemia (CML):** Treatment options include targeted therapy (tyrosine kinase inhibitors) and stem cell transplantation. The goal is to control the growth of the cancer cells and improve the patient's quality of life.
- **Acute Lymphoblastic Leukemia (ALL):** Treatment options include chemotherapy, radiation therapy, and stem cell transplantation. The goal is to kill the cancer cells and restore the bone marrow's ability to produce healthy blood cells.
- **Chronic Lymphocytic Leukemia (CLL):** Treatment options include chemotherapy, radiation therapy, and stem cell transplantation. The goal is to control the growth of the cancer cells and improve the patient's quality of life.
