

Software Architecture Styles

CQRS Architecture
separates read and write operations for a data store. It enables independent scaling of read and write workloads and optimizes them separately.

Layered (n-tier) Architecture
separates software into logical layers.

Microkernel Architecture
separates a minimal functional core from extended functionality and customer-specific parts.

Microservice Architecture
This architecture designs a software application as a suite of independently deployable, small, modular services.

Space-Based Architecture
This resolves the issues of data consistency, reliable performance, and scalability for large-scale distributed systems.

DDD Architecture
focuses on the domain logic and complexity rather than the technology used.

Orchestration Architecture
a central coordinator (often called an orchestrator) that directs the interaction between services. The orchestrator is responsible for managing the control flow and data flow between services.

MVP Architecture
derivative of the Model-View-Controller (MVC) pattern, which aims to separate the concerns of data management, user interface, and control flow.

Event-Driven Architecture
promotes the production, detection, consumption of, and reaction to events.
