An Assessment of Anaerobic Digestion in U.S. Agriculture Ted Thornton,1978 Anaerobic digestion is a biological process in which bacteria break down organic matter to produce methane partially stabilized effluent and other products although the process has been advocated as a source of fuel feed and fertilizer its widespread adoption in American agriculture is doubtful the cost and complexity of most digestive systems make them difficult to incorporate in agricultural operations although site specific applications may be feasible these will not have a major impact on the agricultural sector as a source of energy there is little possibility of anaerobic digestion providing even a small percentage of national energy requirements
