## **Structure Mechanism Function Of The Na:**

*The Sodium-Hydrogen Exchanger* Morris Karmazyn, Metin Avkiran, Larry Fliegel, 2012-12-06 I am extremely honored and pleased to have the opportunity to write a few introductory words for this timely volume on Na<sup>+</sup> exchange. This is a field of investigation that I entered into by challenge and necessity embraced with passion and finally left in my quest for new discoveries in growth control. Ten years, one third of my scientific life has been devoted to uncovering the mysteries of intracellular pH regulation with respect to growth factor action. I got started on this new topic in 1980 when I heard a rather provocative hypothesis presented by Enrique Rozengurt at an ICN UCLA Keystone meeting on Cell Surface and Malignancy. He showed that all mitogens induced amiloride sensitive Na<sup>+</sup> entry into resting cells and proposed that if a compound stimulates Na<sup>+</sup> influx it could be a mitogen. In support of his proposal Enrique reported that the amphipathic polypeptide melittin which induced Na<sup>+</sup> influx was indeed mitogenic for 3T3 cells. This was only correlation at this stage. However I was fascinated by this talk I immediately approached Enrique to inform him of my skepticism about this beautiful story and to indicate that I would only be convinced when I succeeded in isolating mutant fibroblasts lacking the amiloride sensitive Na<sup>+</sup> transporter. Good luck was his response.

*ATPases* A.G. Lee, 1996-12-17 Volume 5 of Biomembranes covers an important group of membrane proteins the ATPases. The P type ATPases couple the hydrolysis of ATP to the movement of ions across a membrane and are characterized by the formation of a phosphorylated intermediate. Included are the plasma membrane and muscle sarcoplasmic reticulum Ca<sup>2+</sup> ATPases the Na<sup>+</sup> K<sup>+</sup> ATPase the gastric H<sup>+</sup> K<sup>+</sup> ATPase the plasma membrane H<sup>+</sup> ATPase of fungi and plants the Mg<sup>2+</sup> transport ATPase the *Salmonella typhimurium* and the K<sup>+</sup> ATPase of *Escherichia coli* KdpB. The other important classes of ATPase in eukaryotic systems are the vacuolar H<sup>+</sup> ATPases and the F<sub>0</sub>F<sub>1</sub> ATP synthase and in bacteria the anion translocating ATPases responsible for resistance to arsenicals and antimonials and the Na<sup>+</sup> Mg<sup>2+</sup> ATPase of *Acholeplasma*. Finally eukaryotic systems contain a variety of ectonucleotidases important for example in hydrolysis of extracellular ATP released as a cotransmitter from cholinergic and adrenergic nerve terminals.

Volume 5 of Biomembranes explores structure function relationships for these membrane bound ATPases.

Ion Channels and Ion Pumps Piero P. Foa, Mary F. Walsh, 2013-03-07 Omnis cellula e cellula every cell from a cell was dogma to the 19th century cellular physiologist and the cornerstone of Virchow's Cellular pathology. Spread out a cell into a layer and you will find that in ceasing to be a cell it has ceased to act as such wrote the British physiologist G R Lewes more than a century ago. The cell remains vital as long as its wall remains intact keeping its content pure and clear and thus preserving the vital principle within echoed Claude Bernard a few years later. The notion of the cell membrane as a protecting envelope held sway until it became clear that it could not account for the coalescence of poorly differentiated embryonic vesicles and for their transformation into cell like structures capable of auto regulation and

yet subject to what the grandfather of one of us defined as the federal obligations imposed by the whole organism 3 A new concept was needed and soon the membrane was described as a structure capable of uniting as well as separating adjacent cells Morphologic evidence for this dual function was obtained several years later when the electron microscope revealed the existence of tight and gap junctions which acting as intercellular bonds and channels allowed the cells to communicate with one another and thus coordinate their biologic activities

*Molecular Biology of Membrane Transport Disorders* Thomas E. Andreoli, A.M. Brown, D.M. Fambrough, Joseph F. Hoffman, Stanley G. Schultz, Michael J. Welsh, 2013-11-11 When the six of us gathered to start planning for what was to be the Third Edition of *Physiology of Membrane Disorders* it was clear that since 1986 when the Second Edition appeared the field had experienced the dawning of a new era dominated by a change in focus from phenomenology to underlying mechanisms propelled by the power of molecular biology In 1985 detailed molecular information was available for only three membrane transporters the lac permease bacterial rhodopsin and the acetylcholine receptor During the decade that has since elapsed almost all of the major ion channels and transport proteins have been cloned sequenced mutagenized and expressed in homologous as well as heterologous cells Few if any of the transporters that were identified during the previous era have escaped the proings of the new molecular technologies and in many instances considerable insight has been gained into their mechanisms of function in health and disease Indeed in some instances novel unexpected transporters have emerged that have yet to have their functions identified The decision to adopt the new title *Molecular Biology of Membrane Transport Disorders* was a natural outgrowth of these considerations
