Structure Property Relationships In Polymers:

Structure—Property Relationships in Polymers Charles E. Carraher Jr., R.B. Seymour, 2012-12-06 The first concern of scientists who are interested in synthetic polymers has always been and still is How are they synthesized But right after this comes the question What have I made and for what is it good This leads to the important topic of the structure property relations to which this book is devoted Polymers are very large and very complicated systems their characterization has to begin with the chemical composition configuration and conformation of the individual molecule The first chapter is devoted to this broad objective The immediate physical consequences discussed in the second chapter form the basis for the physical nature of polymers the supermolecular interactions and arrangements of the individual macromolecules The third chapter deals with the important question How are these chemical and physical structures experimentally determined The existing methods for polymer characterization are enumerated and discussed in this chapter The following chapters go into more detail For most applications textiles films molded or extruded objects of all kinds the mechanical and the thermal behaviors of polymers are of preponderant importance followed by optical and electric properties Chapters 4 through 9 describe how such properties are rooted in and dependent on the chemical structure More detailed considerations are given to certain particularly important and critical properties such as the solubility and permeability of polymeric systems Macromolecules are not always the final goal of the chemist they may act as intermediates reactants or catalysts This topic is presented in Chapters 10 and 11

Structure-property Relationships in Polymers E. H. Andrews, Texas Materials Science Group, 1988 [Structure-Property Relationships of Polymeric Solids](#) Anne Hiltner, 2012-12-12 This book contains a collection of original research papers which were presented in honor of the Bordon Award recipient Professor Eric Baer on the occasion of the 55th Meeting of the American Chemical Society Atlanta Georgia March 1981 The contributors are present or former colleagues and students who have worked with him in the Department of Macromolecular Science at Case Institute of Technology of Case Western Reserve University Throughout his work Eric Baer has attempted to find the relationships of solid state structure and hierarchy to the resultant properties from which specific functions are derived Although he has studied many seemingly unrelated subjects from irreversible deformation mechanics and yield processes in amorphous polymeric solids to structural organization and mechanical function of tendon his unique goal has been to develop models from the real structure that would allow a quantitative description of properties Today this area of microscience is rapidly expanding as new and sophisticated applications of polymeric materials with multifunctional properties are emerging from our understanding and control of the solid state The wide ranging ideas and the originality of Professor Baer's contributions have stimulated many new concepts which are now widely accepted in the field of high polymers The contributions to this volume represent many of the areas which he has explored

Field-Effect Transistors Ting Lei, 2015-01-05 The book summarizes Ting Lei's PhD study on a series of novel conjugated polymers for field effect transistors (FETs). Studies contain many aspects of polymer FETs including backbone design, side chain engineering, property study, conformation effects, and device fabrication. The research results have previously scattered in many important journals and conferences worldwide. The book is likely to be of interest to university researchers, engineers, and graduate students in materials sciences and chemistry who wish to learn some principles, strategy, and applications of polymer FETs.

Structure-property Relationships in Polymers of 2,3-Dichlorobutadiene Mark Alfred Weih, 1991

Structure-Property Relationships of Polymeric Solids American Chemical Society. Meeting, 1983-11 This book contains a collection of original research papers which were presented in honor of the Borden Award recipient Professor Eric Baer on the occasion of the 55th Meeting of the American Chemical Society, Atlanta, Georgia, March 1981. The contributors are present or former colleagues and students who have worked with him in the Department of Macromolecular Science at Case Institute of Technology of Case Western Reserve University. Throughout his work, Eric Baer has attempted to find the relationships of solid state structure and hierarchy to the resultant properties from which specific functions are derived. Although he has studied many seemingly unrelated subjects from irreversible deformation mechanics and yield processes in amorphous polymeric solids to structural organization and mechanical function of tendon, his unique goal has been to develop models from the real structure that would allow a quantitative description of properties. Today, this area of microscience is rapidly expanding as new and sophisticated applications of polymeric materials with multifunctional properties are emerging from our understanding and control of the solid state. The wide-ranging ideas and the originality of Professor Baer's contributions have stimulated many new concepts which are now widely accepted in the field of high polymers. The contributions to this volume represent many of the areas which he has explored.

Structure-property Relationships in Bithiophene and Bithiazole Polymers Matthew Paul Brukwicki, 2001

Structure-property Relationships of PEMs Using Fluorous-ionic Copolymers Ming Wai Emily Tsang, 2011

Proton exchange membranes (PEMs) are a key component in PEM fuel cells, serving as both a fuel separator and an electrolyte. The goal of this thesis work is to investigate structure-property relationships in PEMs. Specifically, the role of polymer microstructure on membrane morphology and physicochemical properties is examined. This is achieved by the design, synthesis, and characterization of

model polymers with controlled chain architectures and chemical composition leading to membranes with controlled nanophase separated morphologies from which the influence of morphology upon proton transport and other membrane properties is investigated Two classes of model polymer systems were devised and studied diblock copolymers of sulfonated poly vinylidene difluoride co hexafluoropropylene b styrene P VDF co HFP b SPS and graft copolymers of sulfonated poly vinylidene difluoride co chlorotrifluoropropylene g styrene P VDF co CTFE g SPS These model polymer systems are of interest due to chemical dissimilarity between the hydrophobic fluoropolymer segments and the hydrophilic sulfonated polystyrene segments which promote phase separation into ionic and non ionic domains In addition controlled radical polymerization techniques were employed to grow the polystyrene segments which provide high degrees of structural control Macromolecular structural parameters such as block ratio graft length and degree of sulfonation were systematically varied to determine the effects of polymer microstructure on morphology and proton conductivity One of the key findings obtained from this work is that block ionomers whether linear or graft structure with a lower content of the acid bearing constituent block i e polystyrene block gave enhanced proton conductivity at a given ion content This is attributed to the relatively high degree of sulfonation required and therefore closer spatial proximity between sulfonic acid groups which allows for the formation of purer and more percolated ionic aggregates within the proton conducting domains Additionally direct comparison between the diblock and the graft copolymers revealed that the formation of smaller scale ionic domains is preferable for PEMs because of reduced water swelling which mitigates acid dilution at high ion contents Furthermore membranes with smaller scale ionic domains provided enhanced water retention and proton conduction under low humidity and high temperature conditions The knowledge gained from this thesis work provides useful insights into aspects of membrane design and preferred structures
