**Soft Computing and Fractal Theory for Intelligent Manufacturing** Oscar Castillo, Patricia Melin, 2012-08-11 We describe in this book new methods for intelligent manufacturing using soft computing techniques and fractal theory Soft Computing SC consists of several computing paradigms including fuzzy logic neural networks and genetic algorithms which can be used to produce powerful hybrid intelligent systems Fractal theory provides us with the mathematical tools to understand the geometrical complexity of natural objects and can be used for identification and modeling purposes Combining SC techniques with fractal theory we can take advantage of the intelligence provided by the computer methods and also take advantage of the descriptive power of the fractal mathematical tools Industrial manufacturing systems can be considered as non linear dynamical systems and as a consequence can have highly complex dynamic behaviors For this reason the need for computational intelligence in these manufacturing systems has now been well recognized We consider in this book the concept of intelligent manufacturing as the application of soft computing techniques and fractal theory for achieving the goals of manufacturing which are production planning and control monitoring and diagnosis of faults and automated quality control As a prelude we provide a brief overview of the existing methodologies in Soft Computing We then describe our own approach in dealing with the problems in achieving intelligent manufacturing Our particular point of view is that to really achieve intelligent manufacturing in real world applications we need to use SC techniques and fractal theory

*Soft Computing and Machine Learning with Python* Zoran Gacovski, 2018-12 A definition states that the machine learning is a discipline that allows the computers to learn without explicit programming The challenge in machine learning is how to accurately algorithmic describe some kinds of tasks that people can easily solve for example face recognition speech recognition etc Such algorithms can be defined for certain types of tasks but they are very complex and or require large knowledge base e g machine translation MT In many of the areas data are continuously collected in order to get some knowledge out of them for example in medicine patient data and therapy in marketing the users customers and what they buy what are they interested in how products are rated etc Data analysis of this scale requires approaches that will allow you to discover patterns and dependences among the data that are neither known nor obvious but can be useful data mining Information retrieval IR is finding existing information as quickly as possible For example web browser finds page within the large set of the entire WWW Machine Learning ML is a set of techniques that generalize existing knowledge of the new information as precisely as possible An example is the speech recognition Data mining DM primarily relates to the disclosure

of something hidden within the data some new dependence which have not previously been known Example is CRM the customer analysis Python is high level programming language that is very suitable for web development programming of games and data manipulation machine learning applications It is object oriented language and interpreter as well allowing the source code to execute directly without compiling This edition covers machine learning theory and applications with Python and includes chapters for soft computing theory machine learning techniques applications Python language details and machine learning examples with Python Book jacket
